COVID-19 Results Briefing

Russian Federation
September 15, 2021

This document contains summary information on the latest projections from the IHME model on COVID-19 in Russian Federation. The model was run on September 14, 2021, with data through September 13, 2021.

Current situation

- Daily infections in the last week decreased to 261,000 per day on average compared to 363,000 the week before (Figure 1). Daily hospital census in the last week (through September 13) decreased to 96,200 per day on average compared to 97,900 the week before.
- Daily reported cases in the last week decreased to 16,700 per day on average compared to 18,100 the week before (Figure 2).
- Reported deaths due to COVID-19 in the last week decreased to 760 per day on average compared to 780 the week before (Figure 3).
- Excess deaths due to COVID-19 in the last week decreased to 5,000 per day on average compared to 5,100 the week before (Figure 3). This makes COVID-19 the number 1 cause of death in Russian Federation this week (Table 1). Estimated excess daily deaths due to COVID-19 in the past week were 6.5 times larger than the reported number of deaths.
- The daily reported COVID-19 death rate is greater than 4 per million in Armenia, Bosnia and Herzegovina, Bulgaria, Georgia, Kazakhstan, Lithuania, Montenegro, North Macedonia, and Russian Federation (Figure 4).
- The daily rate of excess deaths due to COVID-19 is greater than 4 per million in 22 countries (Figure 4).
- We estimate that 88% of people in Russian Federation have been infected as of September 13 (Figure 6).
- Effective R, computed using cases, hospitalizations, and deaths, is greater than 1 in 53 countries Effective R in Russian Federation was 0.8 on September 2 (Figure 7).
- The infection-detection rate in Russian Federation was close to 4% on September 13 (Figure 8).
- Based on the GISAID and various national databases, combined with our variant spread model, we estimate the current prevalence of variants of concern (Figure 9). We estimate that the Beta variant is circulating in 7 countries, that the Delta variant is circulating in 48 countries, and that the Gamma variant is circulating in 22 countries.

Trends in drivers of transmission

- Mobility last week was 5% lower than the pre-COVID-19 baseline (Figure 11). Mobility was near baseline (within 10%) in 44 countries. Mobility was lower than 30% of baseline in no locations.
- As of September 13, in the COVID-19 Trends and Impact Survey, 41% of people self-report that they always wore a mask when leaving their home compared to 42% last week (Figure 13).
- There were 292 diagnostic tests per 100,000 people on September 13 (Figure 15).
- As of September 13, 15 countries have reached 70% or more of the population who have received at least one vaccine dose and 8 countries have reached 70% or more of the population who are fully vaccinated (Figure 17).
- In Russian Federation, 45.5% of adults say they would accept or would probably accept a vaccine for COVID-19. This is up by 0.1 percentage points from last week. The proportion of the population who are open to receiving a COVID-19 vaccine ranges from 34% in Republic of Moldova to 87% in Portugal (Figure 19).
- In our current reference scenario, we expect that 49.4 million people will be vaccinated with at least one dose by January 1 (Figure 20).
- In our current reference scenario, we expect that by January 1, 94% of people will be immune to non-escape variants and 87% of people will be immune to escape variants (Figure 21).
Projections

- In our reference scenario, which represents what we think is most likely to happen, our model projects 210,000 cumulative reported deaths due to COVID-19 on January 1. This represents 20,000 additional deaths from September 13 to January 1. Daily reported deaths will decline to 10 on January 1, 2022 (Figure 22).

- Under our reference scenario, our model projects 1,376,000 cumulative excess deaths due to COVID-19 on January 1. This represents 133,000 additional deaths from September 13 to January 1 (Figure 22).

- If universal mask coverage (95%) were attained in the next week, our model projects 2,300 fewer cumulative reported deaths compared to the reference scenario on January 1.

- Under our worse scenario, our model projects 213,000 cumulative reported deaths on January 1, an additional 2,600 deaths compared to our reference scenario. Daily reported deaths in the worse scenario will decline to 40 on January 1, 2022 (Figure 22).

- Daily infections in the reference scenario will decline to 8,930 on January 1, 2022 (Figure 23). Daily infections in the worse scenario will decline to 23,710 on January 1, 2022 (Figure 23).

- Daily cases in the reference scenario will decline to 400 on January 1, 2022 (Figure 24). Daily cases in the worse scenario will decline to 1,120 on January 1, 2022 (Figure 24).

- Daily hospital census in the reference scenario will decline to 2,400 on January 1, 2022 (Figure 25). Daily hospital census in the worse scenario will decline to 6,770 on January 1, 2022 (Figure 25).

- Figure 26 compares our reference scenario forecasts to other publicly archived models. Forecasts are widely divergent.

- At some point from September through January 1, 27 countries will have high or extreme stress on hospital beds (Figure 27). At some point from September through January 1, 47 countries will have high or extreme stress on intensive care unit (ICU) capacity (Figure 28).

Figure 7. Mean effective R on September 2, 2021. Effective R less than 1 means that transmission should decline, all other things being held the same. The estimate of effective R is based on the combined analysis of deaths, case reporting, and hospitalizations where available. Current reported cases reflect infections 11-13 days prior, so estimates of effective R can only be made for the recent past.
Figure 8. Percent of COVID-19 infections detected. This is estimated as the ratio of reported daily COVID-19 cases to estimated daily COVID-19 infections based on the SEIR disease transmission model. Due to measurement errors in cases and testing rates, the infection-detection rate can exceed 100% at particular points in time.

**Figure 21.** Percentage of people who are immune to non-escape variants and the percentage of people who are immune to escape variants
Projections and scenarios

We produce three scenarios when projecting COVID-19. The reference scenario is our forecast of what we think is most likely to happen:

- Vaccines are distributed at the expected pace. Brand- and variant-specific vaccine efficacy is updated using the latest available information from peer-reviewed publications and other reports.
- Future mask use is the mean of mask use over the last 7 days.
- Mobility increases as vaccine coverage increases.
- Governments adapt their response by re-imposing social distancing mandates for 6 weeks whenever daily deaths reach 8 per million, unless a location has already spent at least 7 of the last 14 days with daily deaths above this rate, and not yet re-imposed social distancing mandates. In this case, the reference scenario assumes that mandates are re-imposed when daily deaths reach 15 per million.
- Variants Alpha, Beta, Gamma, and Delta continue to spread regionally and globally from locations with sufficient transmission.

The worse scenario modifies the reference scenario assumption in four ways:

- 100% of vaccinated individuals stop using masks.
- Mobility increases in all locations to 25% above the pre-pandemic winter baseline, irrespective of vaccine coverage.
- Governments are more reluctant to re-impose social distancing mandates, waiting until the daily death rate reaches 15 per million, unless a location has already spent at least 7 of the last 14 days with daily deaths above this rate, and not yet re-imposed social distancing mandates. In this case, the reference scenario assumes that mandates are re-imposed when daily deaths reach 38 per million. In either case, we assume social distancing mandates remain in effect for 6 weeks.
- Variants Alpha, Beta, Gamma, and Delta spread between locations twice as fast when compared with our reference scenario.

The universal masks scenario makes all the same assumptions as the reference scenario but assumes all locations reach 95% mask use within 7 days.
Figure 22. Daily COVID-19 deaths until January 01, 2022 for three scenarios

A. Reported daily COVID-19 deaths per 100,000

B. Excess daily COVID-19 deaths per 100,000
Figure 23. Daily COVID-19 infections until January 01, 2022 for three scenarios

Figure 24. Daily COVID-19 reported cases until January 01, 2022 for three scenarios
**Figure 25.** Daily COVID-19 hospital census until January 01, 2022 for three scenarios

**Figure 26.** Comparison of reference model projections with other COVID modeling groups. For this comparison, we are including projections of daily COVID-19 deaths from other modeling groups when available: Delphi from the Massachusetts Institute of Technology (Delphi), Imperial College London (Imperial), The Los Alamos National Laboratory (LANL), and the SI-KJalpha model from the University of Southern California (SIKJalpha). Daily deaths from other modeling groups are smoothed to remove inconsistencies with rounding. Regional values are aggregates from available locations in that region.
**Figure 27.** The estimated inpatient hospital usage is shown over time. The percent of hospital beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of beds occupied by COVID-19 patients. Less than 5% is considered *low stress*, 5-9% is considered *moderate stress*, 10-19% is considered *high stress*, and 20% or greater is considered *extreme stress*. 
Figure 28. The estimated intensive care unit (ICU) usage is shown over time. The percent of ICU beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of ICU beds occupied by COVID-19 patients. Less than 10% is considered low stress, 10-29% is considered moderate stress, 30-59% is considered high stress, and 60% or greater is considered extreme stress.

More information

Data sources:
Mask use and vaccine confidence data are from the The Delphi Group at Carnegie Mellon University and University of Maryland COVID-19 Trends and Impact Surveys, in partnership with Facebook. Mask use data are also from Premise, the Kaiser Family Foundation, and the YouGov COVID-19 Behaviour Tracker survey. Genetic sequence and metadata are primarily from the GISAID Initiative. Further details available on the COVID-19 model FAQ page.

A note of thanks:
We wish to warmly acknowledge the support of these and others who have made our COVID-19 estimation efforts possible.
