COVID-19 Results Briefing

Pakistan

September 15, 2021

This document contains summary information on the latest projections from the IHME model on COVID-19 in Pakistan. The model was run on September 14, 2021, with data through September 12, 2021.

Current situation

Reported cases and hospitalizations continue to decline in Pakistan. Deaths increased the past week due to the slight rise in cases three weeks ago. We have extended our projections to January 1. Our model projects 30,000 cumulative reported deaths due to COVID-19 on January 1. This represents 3,000 additional deaths from September 13 to January 1. Daily reported deaths will decline to 10 on January 1, 2022. We also project that daily cases will decline to 650 by December 2, 2021. Schools opening and return to in-person work may increase the chances of a surge in some countries. The strategies to contain the surge remain to increase vaccination coverage and mask wearing, and limit gathering size. Given the available evidence on waning immunity and lower efficacy of vaccines preventing infection as compared to hospitalization and death, strategies to reduce COVID-19 transmission to zero are unlikely to succeed. Ongoing COVID-19 transmission and burden on the health system are likely to extend past the forecast period and well into 2022 and beyond.

- Daily infections in the last week decreased to 313,300 per day on average compared to 394,500 the week before (Figure 1). Daily hospital census in the last week (through September 12) decreased to 70,100 per day on average compared to 75,100 the week before.

- Daily reported cases in the last week decreased to 3,500 per day on average compared to 3,800 the week before (Figure 2).

- Reported deaths due to COVID-19 in the last week increased to 80 per day on average compared to 79 the week before (Figure 3).

- Excess deaths due to COVID-19 in the last week stayed steady at 330 per day on average (Figure 3). This makes COVID-19 the number 3 cause of death in Pakistan this week (Table 1). Estimated excess daily deaths due to COVID-19 in the past week were 4.1 times larger than the reported number of deaths.

- No locations had daily reported COVID-19 death rates greater than 4 per million (Figure 4).

- No locations had daily excess death rates greater than 4 per million (Figure 4).

- We estimate that 81% of people in Pakistan have been infected as of September 13 (Figure 6).
• Effective R, computed using cases, hospitalizations, and deaths, is greater than 1 in no provinces or territories (Figure 7).

• The infection-detection rate in Pakistan was close to 1% on September 13 (Figure 8).

• Based on the GISAID and various national databases, combined with our variant spread model, we estimate the current prevalence of variants of concern (Figure 9). We estimate that the Beta variant is circulating in no provinces or territories, that the Delta variant is circulating in six provinces and territories, and that the Gamma variant is circulating in two provinces and territories.

Trends in drivers of transmission

• Mobility last week was 23% higher than the pre-COVID-19 baseline (Figure 11). Mobility was near baseline (within 10%) in Azad Jammu & Kashmir, Balochistan, Gilgit-Baltistan, Islamabad Capital Territory, Khyber Pakhtunkhwa, Punjab, and Sindh. Mobility was lower than 30% of baseline in no locations.

• As of September 13, in the COVID-19 Trends and Impact Survey, 46% of people self-report that they always wore a mask when leaving their home, the same as last week (Figure 13).

• There were 26 diagnostic tests per 100,000 people on September 13 (Figure 15).

• As of September 13, no provinces or territories have reached 70% or more of the population who have received at least one vaccine dose, and no provinces or territories have reached 70% or more of the population who are fully vaccinated (Figure 17).

• In Pakistan, 64.6% of adults say they would accept or would probably accept a vaccine for COVID-19. This is down by 0.3 percentage points from last week. The proportion of the population who are open to receiving a COVID-19 vaccine ranges from 58% in Azad Jammu & Kashmir to 82% in Islamabad Capital Territory (Figure 19).

• In our current reference scenario, we expect that 75.0 million people will be vaccinated with at least one dose by January 1 (Figure 20).

• In our current reference scenario, we expect that by January 1, 87% of people will be immune to non-escape variants and 80% of people will be immune to escape variants (Figure 21).

Projections

• In our reference scenario, which represents what we think is most likely to happen, our model projects 30,000 cumulative reported deaths due to COVID-19 on January 1. This represents 3,000 additional deaths from September 13 to January 1. Daily reported deaths will decline to 10 on January 1, 2022 (Figure 22).

• Under our reference scenario, our model projects 124,000 cumulative excess deaths due to COVID-19 on January 1. This represents 13,000 additional deaths from September 13 to January 1 (Figure 22).
• If universal mask coverage (95%) were attained in the next week, our model projects 720 fewer cumulative reported deaths compared to the reference scenario on January 1.

• Under our worse scenario, our model projects 30,000 cumulative reported deaths on January 1, an additional 370 deaths compared to our reference scenario. Daily reported deaths in the worse scenario will decline to 10 on January 1, 2022 (Figure 22).

• Daily infections in the reference scenario will decline to 34,270 on January 1, 2022 (Figure 23). Daily infections in the worse scenario will decline to 50,970 on January 1, 2022 (Figure 23).

• Daily cases in the reference scenario will decline to 650 by December 2, 2021 (Figure 24). Daily cases in the worse scenario will decline to 910 on January 1, 2022 (Figure 24).

• Daily hospital census in the reference scenario will decline to 4,920 on January 1, 2022 (Figure 25). Daily hospital census in the worse scenario will decline to 7,400 on January 1, 2022 (Figure 25).

• Figure 26 compares our reference scenario forecasts to other publicly archived models. Forecasts are widely divergent.

• At some point from September through January 1, 6 provinces and territories will have high or extreme stress on hospital beds (Figure 27). At some point from September through January 1, 7 provinces and territories will have high or extreme stress on intensive care unit (ICU) capacity (Figure 28).

Figure 5. Cumulative COVID-19 deaths per 100,000 on September 13, 2021

A. Reported cumulative COVID-19 deaths per 100,000

B. Excess cumulative COVID-19 deaths per 100,000
Figure 6. Estimated percent of the population infected with COVID-19 on September 13, 2021

Figure 7. Mean effective R on September 2, 2021. Effective R less than 1 means that transmission should decline, all other things being held the same. The estimate of effective R is based on the combined analysis of deaths, case reporting, and hospitalizations where available. Current reported cases reflect infections 11-13 days prior, so estimates of effective R can only be made for the recent past.
**Figure 8.** Percent of COVID-19 infections detected. This is estimated as the ratio of reported daily COVID-19 cases to estimated daily COVID-19 infections based on the SEIR disease transmission model. Due to measurement errors in cases and testing rates, the infection-detection rate can exceed 100% at particular points in time.

Table 3. Estimates of vaccine efficacy for specific vaccines used in the model at preventing disease and infection. The SEIR model uses variant-specific estimates of vaccine efficacy at preventing symptomatic disease and at preventing infection. We use data from clinical trials directly, where available, and make estimates otherwise. More information can be found on our website.

Figure 17. Percent of the population (A) having received at least one dose and (B) fully vaccinated against SARS-CoV-2 by September 13, 2021

A. Percent of the population having received one dose of a COVID-19 vaccine

B. Percent of the population fully vaccinated against SARS-CoV-2
Figure 18. Trend in the estimated proportion of the adult (18+) population that have been vaccinated or would probably or definitely receive the COVID-19 vaccine if available.

Figure 19. This figure shows the estimated proportion of the adult (18+) population that has been vaccinated or would probably or definitely receive the COVID-19 vaccine if available.
Figure 20. Percent of people who receive at least one dose of a COVID-19 vaccine and those who are fully vaccinated

Figure 21. Percentage of people who are immune to non-escape variants and the percentage of people who are immune to escape variants
Projections and scenarios

We produce three scenarios when projecting COVID-19. The reference scenario is our forecast of what we think is most likely to happen:

- Vaccines are distributed at the expected pace. Brand- and variant-specific vaccine efficacy is updated using the latest available information from peer-reviewed publications and other reports.
- Future mask use is the mean of mask use over the last 7 days.
- Mobility increases as vaccine coverage increases.
- Governments adapt their response by re-imposing social distancing mandates for 6 weeks whenever daily deaths reach 8 per million, unless a location has already spent at least 7 of the last 14 days with daily deaths above this rate, and not yet re-imposed social distancing mandates. In this case, the reference scenario assumes that mandates are re-imposed when daily deaths reach 15 per million.
- Variants Alpha, Beta, Gamma, and Delta continue to spread regionally and globally from locations with sufficient transmission.

The worse scenario modifies the reference scenario assumption in four ways:

- 100% of vaccinated individuals stop using masks.
- Mobility increases in all locations to 25% above the pre-pandemic winter baseline, irrespective of vaccine coverage.
- Governments are more reluctant to re-impose social distancing mandates, waiting until the daily death rate reaches 15 per million, unless a location has already spent at least 7 of the last 14 days with daily deaths above this rate, and not yet re-imposed social distancing mandates. In this case, the reference scenario assumes that mandates are re-imposed when daily deaths reach 38 per million. In either case, we assume social distancing mandates remain in effect for 6 weeks.
- Variants Alpha, Beta, Gamma, and Delta spread between locations twice as fast when compared with our reference scenario.

The universal masks scenario makes all the same assumptions as the reference scenario but assumes all locations reach 95% mask use within 7 days.
Figure 22. Daily COVID-19 deaths until January 01, 2022 for three scenarios

A. Reported daily COVID-19 deaths per 100,000

B. Excess daily COVID-19 deaths per 100,000
Figure 23. Daily COVID-19 infections until January 01, 2022 for three scenarios

Figure 24. Daily COVID-19 reported cases until January 01, 2022 for three scenarios
Figure 25. Daily COVID-19 hospital census until January 01, 2022 for three scenarios

Figure 26. Comparison of reference model projections with other COVID modeling groups. For this comparison, we are including projections of daily COVID-19 deaths from other modeling groups when available: Delphi from the Massachusetts Institute of Technology (Delphi), Imperial College London (Imperial), The Los Alamos National Laboratory (LANL), and the SI-KJalpha model from the University of Southern California (SIKJalpha). Daily deaths from other modeling groups are smoothed to remove inconsistencies with rounding. Regional values are aggregates from available locations in that region.
Figure 27. The estimated inpatient hospital usage is shown over time. The percent of hospital beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of beds occupied by COVID-19 patients. Less than 5% is considered low stress, 5-9% is considered moderate stress, 10-19% is considered high stress, and 20% or greater is considered extreme stress.
**Figure 28.** The estimated intensive care unit (ICU) usage is shown over time. The percent of ICU beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of ICU beds occupied by COVID-19 patients. Less than 10% is considered *low stress*, 10-29% is considered *moderate stress*, 30-59% is considered *high stress*, and 60% or greater is considered *extreme stress*. 
More information

Data sources:
Mask use and vaccine confidence data are from the The Delphi Group at Carnegie Mellon University and University of Maryland COVID-19 Trends and Impact Surveys, in partnership with Facebook. Mask use data are also from Premise, the Kaiser Family Foundation, and the YouGov COVID-19 Behaviour Tracker survey.
Genetic sequence and metadata are primarily from the GISAID Initiative. Further details available on the COVID-19 model FAQ page.

A note of thanks:
We wish to warmly acknowledge the support of these and others who have made our COVID-19 estimation efforts possible.
