COVID-19 Results Briefing

The Eastern Mediterranean Region

April 15, 2021

This document contains summary information on the latest projections from the IHME model on COVID-19 in the Eastern Mediterranean Region. The model was run on April 13, 2021, with data through April 12, 2021.

Current situation

Cases and deaths are rising in the region. Mask wearing remains low and mobility high. The rapid spread of the B.1.1.7 variant is causing an increase in cases in many countries, especially in Iran. Our model projects about 269,000 cumulative deaths on August 1, 2021. This represents about 102,000 additional deaths from April 12 to August 1. Daily deaths will peak at 1,300 on May 12, 2021. If universal mask coverage (95%) were attained in the next week, our model projects about 44,000 fewer cumulative deaths compared to the reference scenario on August 1, 2021. The slow decline in vaccine hesitancy that may be due to the pause of the AstraZeneca and Johnson & Johnson vaccines needs to be addressed. Efforts to increase mask wearing, reduce mobility, and avoid large gatherings that may increase during Ramadan should become a priority to contain the pandemic.

- Daily reported cases in the last week increased to about 50,700 per day on average compared to about 42,000 the week before (Figure 1).
- Daily deaths in the last week increased to about 670 per day on average compared to about 570 the week before (Figure 2). This makes COVID-19 the number 4 cause of death in the Eastern Mediterranean Region this week (Table 1).
- The daily death rate is greater than 4 per million in Jordan, Lebanon, Palestine, and Tunisia (Figure 3).
- We estimated that 8% of people in the Eastern Mediterranean Region have been infected as of April 12 (Figure 4).
- Effective R, computed using cases, hospitalizations, and deaths, is greater than 1 in 14 countries (Figure 5).
- The infection detection rate in the Eastern Mediterranean Region is close to 16% on April 12 (Figure 6).

Trends in drivers of transmission

- Mobility last week was 4% lower than the pre-COVID-19 baseline (Figure 9). Mobility was near baseline (within 10%) in 12 countries. Mobility was lower than 30% of baseline in Lebanon.
• As of April 12, we estimated that 46% of people always wore a mask when leaving their home, unchanged from last week (Figure 11). Mask use was lower than 50% in Afghanistan, Djibouti, Egypt, Iraq, Libya, Morocco, Palestine, Somalia, Sudan, Tunisia, and Yemen.

• There were 90 diagnostic tests per 100,000 people on April 12 (Figure 13).

• In the Eastern Mediterranean Region, 67.2% of people say they would accept or would probably accept a vaccine for COVID-19. This is down by 0.3 percentage points from last week. The fraction of the population who are open to receiving a COVID-19 vaccine ranges from 38% in Somalia to 86% in Qatar (Figure 17).

• In our current reference scenario, we expect that about 160 million will be vaccinated by August 1 (Figure 18).

Projections

• In our reference scenario, which represents what we think is most likely to happen, our model projects about 269,000 cumulative deaths on August 1, 2021. This represents about 102,000 additional deaths from April 12 to August 1 (Figure 19). Daily deaths will peak at 1,300 on May 12, 2021 (Figure 20).

• If universal mask coverage (95%) were attained in the next week, our model projects about 44,000 fewer cumulative deaths compared to the reference scenario on August 1, 2021 (Figure 19).

• Under our worse scenario, our model projects about 278,000 cumulative deaths on August 1, 2021, an additional about 8,500 deaths compared to our reference scenario (Figure 19).

• By August 1, we project that about 13,100 lives will be saved by the projected vaccine rollout.

• Figure 22 compares our reference scenario forecasts to other publicly archived models. Forecasts are widely divergent.

• At some point from April through August 1, 14 countries will have high or extreme stress on hospital beds (Figure 23). At some point from April through August 1, 16 countries will have high or extreme stress on ICU capacity (Figure 24).
Model updates

There are no major updates in the model this week.

Figure 2. Reported daily COVID-19 deaths and smoothed trend estimate.
Figure 3. Daily COVID-19 death rate per 1 million on April 12, 2021

Figure 4. Estimated percent of the population infected with COVID-19 on April 12, 2021
Figure 5. Mean effective R on April 01, 2021. The estimate of effective R is based on the combined analysis of deaths, case reporting, and hospitalizations where available. Current reported cases reflect infections 11-13 days prior, so estimates of effective R can only be made for the recent past. Effective R less than 1 means that transmission should decline, all other things being held the same.
Figure 6. Percent of COVID-19 infections detected. This is estimated as the ratio of reported daily COVID-19 cases to estimated daily COVID-19 infections based on the SEIR disease transmission model.

*Due to measurement errors in cases and testing rates, the infection to detection rate (IDR) can exceed 100% at particular points in time.

**Figure 17.** This figure shows the estimated proportion of the adult (18+) population that has been vaccinated or is open to receiving a COVID-19 vaccine based on Facebook survey responses (yes and yes, probably).
Figure 18. The number of people who receive any vaccine and those who are effectively vaccinated and protected against disease, accounting for efficacy, loss to follow up for two-dose vaccines, partial immunity after one dose, and immunity after two doses.
Projections and scenarios

We produce three scenarios when projecting COVID-19. The reference scenario is our forecast of what we think is most likely to happen:

- Vaccines are distributed at the expected pace.
- Governments adapt their response by re-imposing social distancing mandates for 6 weeks whenever daily deaths reach 8 per million, unless a location has already spent at least 7 of the last 14 days with daily deaths above this rate and not yet re-imposed social distancing mandates. In this case, the scenario assumes that mandates are re-imposed when daily deaths reach 15 per million.
- Variants B.1.1.7 (first identified in the UK), B.1.351 (first identified in South Africa), and P1 (first identified in Brazil) continue to spread from locations with (a) more than 5 sequenced variants, and (b) reports of community transmission, to adjacent locations following the speed of variant scale-up observed in the regions of the UK.
- In one-quarter of those vaccinated, mobility increases toward pre-COVID-19 levels.

The worse scenario modifies the reference scenario assumptions in three ways:

- First, it assumes that variants B.1.351 or P1 begin to spread within 3 weeks in adjacent locations that do not already have B.1.351 or P1 community transmission.
- Second, it assumes that all those vaccinated increase their mobility toward pre-COVID-19 levels.
- Third, it assumes that among those vaccinated, mask use starts to decline exponentially one month after completed vaccination.

The universal masks scenario makes all the same assumptions as the reference scenario but also assumes 95% of the population wear masks in public in every location.
Figure 19. Cumulative COVID-19 deaths until August 01, 2021 for three scenarios

Figure 20. Daily COVID-19 deaths until August 01, 2021 for three scenarios,
Figure 21. Daily COVID-19 infections until August 01, 2021 for three scenarios.
Figure 22. Comparison of reference model projections with other COVID modeling groups. For this comparison, we are including projections of daily COVID-19 deaths from other modeling groups when available: Delphi from the Massachusetts Institute of Technology (Delphi; https://www.covidanalytics.io/home), Imperial College London (Imperial; https://www.covidsim.org), The Los Alamos National Laboratory (LANL; https://covid-19.bsvgateway.org/), and the SI-KJalpha model from the University of Southern California (SIKJalpha; https://github.com/scc-usc/ReCOVER-COVID-19). Daily deaths from other modeling groups are smoothed to remove inconsistencies with rounding. Regional values are aggregates from available locations in that region.
**Figure 23.** The estimated inpatient hospital usage is shown over time. The percent of hospital beds occupied by COVID-19 patients is color coded based on observed quantiles of the maximum proportion of beds occupied by COVID-19 patients. Less than 5% is considered low stress, 5-9% is considered moderate stress, 10-19% is considered high stress, and greater than 20% is considered extreme stress.
**Figure 24.** The estimated intensive care unit (ICU) usage is shown over time. The percent of ICU beds occupied by COVID-19 patients is color coded based on observed quantiles of the maximum proportion of ICU beds occupied by COVID-19 patients. Less than 10% is considered *low stress*, 10-29% is considered *moderate stress*, 30-59% is considered *high stress*, and greater than 60% is considered *extreme stress*. 
More information

Data sources:
Mask use data sources include Premise: Facebook Global Symptom Survey (This research is based on survey results from University of Maryland Social Data Science Center) and the Facebook United States Symptom Survey (in collaboration with Carnegie Mellon University); Kaiser Family Foundation; YouGov COVID-19 Behaviour Tracker survey.

Vaccine hesitancy data are from the COVID-19 Beliefs, Behaviors, and Norms Study, a survey conducted on Facebook by the Massachusetts Institute of Technology (https://covidsurvey.mit.edu/).

Vaccine hesitancy data are from the Facebook Global Symptom Survey (This research is based on survey results from University of Maryland Social Data Science Center), the Facebook United States Symptom Survey (in collaboration with Carnegie Mellon University), and from the Facebook COVID-19 Beliefs, Behaviors, and Norms Study conducted by the Massachusetts Institute of Technology.

Genetic sequence and metadata are primarily from the GISAID Initiative. Further details available on the COVID-19 model FAQ page.

A note of thanks:
We wish to warmly acknowledge the support of these and others who have made our COVID-19 estimation efforts possible.
