

The burden of antimicrobial resistance (AMR) in Cook Islands

AMR represents a global challenge

- **4.95 million** people who died in 2019 suffered from drug-resistant infections.
- AMR directly caused **1.27 million** of those deaths.
- **1 in 5** of those deaths occurred among children under 5 years old.

Figure 1 Global number of deaths by GBD cause and those associated with AMR

The length of each bar states the number of deaths by GBD cause and those associated with AMR in 2019.

AMR burden in Cook Islands

- In **Cook Islands** in 2019, there were **3** deaths attributable to AMR and **12** deaths associated with AMR.
- **Cook Islands** has the **76th lowest** age-standardized mortality rate per 100,000 population associated with AMR across 204 countries.

Figure 2. Age-standardized mortality rate associated with AMR in 2019 for 204 locations

The length of each bar states the age-standardized mortality rate per 100,000 population associated with AMR in 2019.

- In the GBD region of **Oceania**, **Cook Islands** has the **2nd lowest** age-standardized mortality across **18** countries.

- The number of AMR deaths in **Cook Islands** is higher than deaths from **respiratory infections and tuberculosis, chronic respiratory diseases, neurological disorders, digestive diseases, and transport injuries.**

Figure 3. Placing AMR in context with other causes of death in 2019, Cook Islands

The length of each bar states the number of deaths by GBD cause and those associated with/attribution to AMR in 2019.

- There are five pathogens to be aware of in **Cook Islands** (number of deaths associated with AMR in parentheses): ***Acinetobacter baumannii* (2)**, ***Staphylococcus aureus* (2)**, ***Streptococcus pneumoniae* (2)**, ***Escherichia coli* (1)**, and ***Klebsiella pneumoniae* (1)**.
- These commonly caused **bloodstream infections, lower respiratory infections and all related infections in the thorax, and peritoneal and intra-abdominal infections.**
- According to the Tracking AMR Country Self-Assessment Survey (TrACSS)1], “**a National AMR action plan has been approved and implemented**” in **Cook Islands**. The next step is that the plan should be “**financed and monitored**” in the short term, and this data should be used to ensure this progression.

1 World Health Organization (WHO). TrACSS 2021-2022 [Internet]. [cited 2023 Feb 16]. Available from: <https://amrcountryprogress.org/download/AMR-self-assessment-survey-responses-2020-2021.xlsx>

Addendum: A summary of data sources for Cook Islands

In total, 471 million individual records or isolates covering 7,585 study-location-years were used as input data to our estimation process to develop the most comprehensive set of AMR estimates to date. There was no input data accessible that could be used to inform these country estimates. Estimates were informed by results from the Global Burden of Disease study and data from the surrounding region. Any datasets that could be used to improve these estimates in the future are welcome. Going forward, new strategies for data preparation, implementation of more usable data, and inclusion of new systematic literature reviews will result in an enhanced overall analysis. Specific policies that will improve AMR surveillance and link outcomes with resistance data will help us improve this research endeavor. If we expand the quantity and quality of data in this country (but also worldwide), we are confident that future iterations of these estimates (but also those of other research groups) will be able to assess the effect of AMR even more precisely and help tailor optimal approaches to ever-increasing threat of antibiotic resistance.

More information

About GRAM:

The purpose of the Global Research on AntiMicrobial resistance (GRAM) project is to **generate accurate and timely estimates of the magnitude and trends in antimicrobial resistance (AMR) burden** across the world, which can be used to inform treatment guidelines and agendas for decision-making and research, detect emerging problems and monitor trends to inform global strategies, as well as facilitate the assessment of interventions over time.

GRAM is the flagship project of the University of Oxford–IHME Strategic Partnership. GRAM was launched with support from the United Kingdom Department of Health and Social Care’s Fleming Fund, the Wellcome Trust, and the Bill & Melinda Gates Foundation.
