

## COVID-19 Results Briefing

### Libya

December 15, 2022

This document contains summary information on the latest projections from the IHME model on COVID-19 in Libya. The model was run on December 15, 2022, with data through December 5, 2022.

The situation in Libya is improving after a recent surge in case and infections. Nonetheless, due to low vaccination rates, waning immunity from vaccines and previous infections, low mask wearing, high mobility, and seasonality of the virus a new surge could occur. We estimated that more than 90% of the population in the country have been infected by COVID at least once. The detection rate remains very low in the country due to limited testing.

The change of policy in China away from zero-COVID will result in a rapid rise of infections and deaths. The policy environment in China, with a population with lower immunity than essentially all other countries, will likely determine the global epidemic in the next four months.

Our model projects 6,400 cumulative reported deaths due to COVID-19 on April 1. We do not project a stress on hospitals in Libya in the coming months from COVID. However, reports of increased infections of RSV and influenza in many parts of the world combined with COVID-19 may pose stress on the medical systems.

Our reference scenario does not include the emergence of new Omicron subvariants. The emergence of a new variant with immune escape and increased severity is the most concerning possibility. Even without increased transmissibility, a variant with sufficient immune escape could replace Omicron, and increased severity could return the world to the much higher death rates of 2021. Continued waves of Omicron subvariants that increase immunity levels in the population may actually reduce the risk of such an event.

From a policy perspective, global surveillance is critical so that the emergence of a new variant that is more severe is identified early, allowing various governments to prepare and respond. Global surveillance, however, is becoming less intense. The best measure of transmission now is hospital admissions, but there is less reporting, not more, of COVID-19 hospital admissions. Existing tools (vaccination, monoclonals, and antivirals) should be widely available and will help mitigate the impact of COVID-19

### Current situation

- Daily infections in the last week decreased to 27,000 per day on average compared to 29,000 the week before (Figure 1.1).
- Daily reported cases in the last week increased to nine per day on average compared to five the week before (Figure 2.1).

- Daily hospital census in the last week (through December 5) increased to 95 per day on average compared to 80 the week before.
- Reported deaths due to COVID-19 in the last week remained the same at zero per day on average compared to the week before (Figure 3.1).
- Total deaths due to COVID-19 in the last week remained the same at zero per day on average compared to the week before (Figure 3.1). This makes COVID-19 the number 59 cause of death in Libya this week (Table 1). Estimated total daily deaths due to COVID-19 in the past week were 5.4 times larger than the reported number of deaths.
- The daily rate of reported deaths due to COVID-19 is greater than 4 per million in no countries (Figure 4.1).
- The daily rate of total deaths due to COVID-19 is greater than 4 per million in no countries (Figure 4.2).
- We estimate that 98% of people in Libya have been infected at least once as of December 12 (Figure 6.1). Effective R, computed using cases, hospitalizations, and deaths, is greater than 1 in 15 countries and five subnational locations. Effective R in Libya was 1.2 on December 1 (Figure 7.1).
- The infection-detection rate in Libya was close to 1% on December 12 (Figure 8.1).
- Based on the GISAID and various national databases, combined with our variant spread model, we estimate the current prevalence of variants of concern (Figures 9.1-9.6). We estimate that the Alpha variant is circulating in 14 countries and seven subnational locations, that the Beta variant is circulating in one country and no subnational locations, that the Delta variant is circulating in 19 countries and six subnational locations, that the Gamma variant is circulating in no countries and no subnational locations, that the BA.1/BA.2 variants are circulating in 21 countries and seven subnational locations, and that the BA.5 variant is circulating in 21 countries and seven subnational locations.

## Trends in drivers of transmission

- Based on self-reported mask use data collected in the COVID-19 Trends and Impact Survey, an estimated 5% of people are projected to always wear a mask when leaving their home. Mask use after June 24, 2022 is a statistical forecast.
- As of December 12, seven countries and no subnational locations have reached 70% or more of the population who have received at least one vaccine dose, and five countries and no subnational locations have reached 70% or more of the population who are fully vaccinated (Figures 12.1 and 12.2). 34% of people in Libya have received at least one vaccine dose, and 24% are fully vaccinated.
- In our current reference scenario, we expect that 2.3 million people will be vaccinated with at least one dose by April 1 (Figure 14.1). We expect that 31% of the population will be fully vaccinated by April 1.

## Projections and scenarios

We produce three scenarios when projecting COVID-19. The **reference scenario** is our forecast of what we think is most likely to happen:

- Vaccines are distributed at the expected pace. Brand- and variant-specific vaccine efficacy is updated using the latest available information from peer-reviewed publications and other reports.
- Future mask use will decline to 50% of the minimum level it reached between January 1, 2021, and May 1, 2022. This decline begins after the last observed data point in each location and transitions linearly to the minimum over a period of six weeks.
- Mobility increases as vaccine coverage increases.
- Mandates will be reimposed at the maximum level of mandates in the post-ancestral period once the death rate has reached an algorithmic minimum threshold of daily reported deaths for a given location.
- 80% of those who are fully vaccinated (two doses for most vaccines, or one dose for Johnson & Johnson) receive an additional dose six months after becoming fully vaccinated, and 80% of those who receive an additional dose receive a second additional dose six months later.
- Antiviral utilization for COVID-19 risk prevention has reached 80% in high-risk populations and 50% in low-risk populations between March 1, 2022, and June 1, 2022. This applies in high-income countries, but not low- and middle-income countries, and this rollout assumption follows a similar pattern to global vaccine rollouts.

The **80% mask use scenario** makes all the same assumptions as the reference scenario but assumes all locations reach 80% mask use within seven days. If a location currently has higher than 80% use, mask use remains at the current level.

The **antiviral access scenario** makes all the same assumptions as the reference scenario but assumes globally distributed antivirals and extends coverage to all low- and middle-income countries between August 15, 2022, and September 15, 2022.

### Infections

- Daily estimated infections in the **reference scenario** will decline to 17,410 by February 21, 2023 (Figure 16.1).
- Daily estimated infections in the **80% mask use scenario** will decline to 9,560 by January 10, 2023 (Figure 16.1).
- Daily estimated infections in the **antiviral access scenario** will decline to 17,410 by February 21, 2023 (Figure 16.1).

### Cases

- Daily estimated cases in the **reference scenario** will rise to 30 by January 2, 2023 (Figure 16.2).
- Daily estimated cases in the **80% mask use scenario** will rise to 20 by December 22, 2022 (Figure 16.2).

- Daily estimated cases in the **antiviral access scenario** will rise to 30 by January 2, 2023 (Figure 16.2).

#### Hospitalizations

- Daily hospital census in the **reference scenario** will rise to 100 by December 19, 2022 (Figure 16.3). At some point from December through April 1, no countries will have high or extreme stress on hospital beds (Figure 18.1). At some point from December through April 1, no countries will have high or extreme stress on intensive care unit (ICU) capacity (Figure 19.1).
- Daily hospital census in the **80% mask use scenario** will rise to 100 by December 17, 2022 (Figure 16.3).
- Daily hospital census in the **antiviral access scenario** will rise to 100 by December 19, 2022 (Figure 16.3).

#### Deaths

- In our **reference scenario**, our model projects 6,500 cumulative reported deaths due to COVID-19 on April 1. This represents 25 additional deaths from December 12 to April 1. Daily reported COVID-19 deaths in the **reference scenario** will decline to zero by January 21, 2023 (Figure 16.4).
- Under our **reference scenario**, our model projects 36,000 cumulative total deaths due to COVID-19 on April 1. This represents 140 additional deaths from December 12 to April 1 (Figure 16.5).
- In our **80% mask use scenario**, our model projects 6,500 cumulative reported deaths due to COVID-19 on April 1. This represents 10 additional deaths from December 12 to April 1. Daily reported COVID-19 deaths in the **80% mask use scenario** will decline to zero by January 4, 2023 (Figure 16.4).
- In our **antiviral access scenario**, our model projects 6,500 cumulative reported deaths due to COVID-19 on April 1. This represents 22 additional deaths from December 12 to April 1. Daily reported COVID-19 deaths in the **antiviral access scenario** will decline to zero by January 14, 2023 (Figure 16.4).
- Figure 17.1 compares our reference scenario forecasts to other publicly archived models. Forecasts are widely divergent.

## Model updates

We have updated our reference scenario to assume that mandates will be re-imposed at the maximum level of mandates in the post-ancestral period once the death rate has reached an algorithmic minimum threshold of daily reported deaths for a given location.

For the foreseeable future, we will not be updating our model or producing COVID-19 estimates. These will be the final briefing documents we produce until further notice.
