COVID-19 Results Briefing

Thailand

July 19, 2022

This document contains summary information on the latest projections from the IHME model on COVID-19 in Thailand. The model was run on July 15, 2022, with data through July 11, 2022.

Current situation

- Daily infections in the last week increased to 111,000 per day on average compared to 96,000 the week before (Figure 1.1). Daily hospital census in the last week (through July 11) increased to 1,800 per day on average compared to 1,600 the week before.
- Daily reported cases in the last week increased to 2,400 per day on average compared to 2,300 the week before (Figure 2.1).
- Reported deaths due to COVID-19 in the last week increased to 21 per day on average compared to 16 the week before (Figure 3.1).
- Total deaths due to COVID-19 in the last week increased to 30 per day on average compared to 23 the week before (Figure 3.1). This makes COVID-19 the number 13 cause of death in Thailand this week (Table 1). Estimated total daily deaths due to COVID-19 in the past week were 1.4 times larger than the reported number of deaths.
- The daily rate of reported deaths due to COVID-19 is greater than 4 per million in one country (Figure 4.1).
- The daily rate of total deaths due to COVID-19 is greater than 4 per million in one country (Figure 4.2).
- We estimate that 71% of people in Thailand have been infected at least once as of July 11 (Figure 6.1). Effective R, computed using cases, hospitalizations, and deaths, is greater than 1 in eight countries and 18 subnational locations. Effective R in Thailand was 1.2 on June 30 (Figure 7.1).
- Based on the GISAID and various national databases, combined with our variant spread model, we estimate the current prevalence of variants of concern (Figures 8.1-8.5). We estimate that the Alpha variant is circulating in eight countries and 26 subnational locations, that the Beta variant is circulating in three countries and seven subnational locations, that the Delta variant is circulating in 11 countries and 35 subnational locations, that the Gamma variant is circulating in four countries and five subnational locations, and that the Omicron variant is circulating in 11 countries and 35 subnational locations.

Trends in drivers of transmission

- Mobility last week was 3% lower than the pre-COVID-19 baseline (Figure 10.1). Mobility was lower than 15% of baseline in one country (Figure 11.1).
- As of June 24, in the COVID-19 Trends and Impact Survey, 71% of people self-reported that they always wore a mask when leaving their home compared to 71% the previous week (Figure 12.1).
- There were 21 diagnostic tests per 100,000 people on July 11 (Figure 14.1).
- As of July 11, nine countries and 16 subnational locations have reached 70% or more of the population who have received at least one vaccine dose, and six countries and 11 subnational locations have reached 70% or more of the population who are fully vaccinated (Figures 16.1 and 16.2). 82% of people in Thailand have received at least one vaccine dose, and 76% are fully vaccinated.
- As of June 24, 2022, two percent of the population in Thailand say they would accept a vaccine for COVID-19 but have not yet been vaccinated.
- In our current reference scenario, we expect that 60.1 million people will be vaccinated with at least one dose by November 1 (Figure 18.1). We expect that 79% of the population will be fully vaccinated by November 1.
Projections and scenarios

We produce three scenarios when projecting COVID-19. The **reference scenario** is our forecast of what we think is most likely to happen:

- Vaccines are distributed at the expected pace. Brand- and variant-specific vaccine efficacy is updated using the latest available information from peer-reviewed publications and other reports.
- Future mask use will decline to 50% of the minimum level it reached between January 1, 2021, and May 1, 2022. This decline begins after the last observed data point in each location and transitions linearly to the minimum over a period of six weeks.
- Mobility increases as vaccine coverage increases.
- 80% of those who are fully vaccinated (two doses for most vaccines, or one dose for Johnson & Johnson) receive an additional dose six months after becoming fully vaccinated, and 80% of those who receive an additional dose receive a second additional dose six months later.
- Antiviral utilization for COVID-19 risk prevention has reached 80% in high-risk populations and 50% in low-risk populations between March 1, 2022, and June 1, 2022. This applies in high-income countries, but not low- and middle-income countries, and this rollout assumption follows a similar pattern to global vaccine rollouts.

The **80% mask use scenario** makes all the same assumptions as the reference scenario but assumes all locations reach 80% mask use within seven days. If a location currently has higher than 80% use, mask use remains at the current level.

The **antiviral access scenario** makes all the same assumptions as the reference scenario but assumes globally distributed antivirals and extends coverage to all low- and middle-income countries between August 15, 2022, and September 15, 2022.

**Infections**

- Daily estimated infections in the **reference scenario** will rise to 151,750 by August 12, 2022 (Figure 20.1).
- Daily estimated infections in the **80% mask use scenario** will decline to 33,450 by October 2, 2022 (Figure 20.1).
- Daily estimated infections in the **antiviral access scenario** will rise to 151,750 by August 12, 2022 (Figure 20.1).

**Cases**

- Daily estimated cases in the **reference scenario** will rise to 7,390 by August 22, 2022 (Figure 20.2).
- Daily estimated cases in the **80% mask use scenario** will rise to 4,080 by August 5, 2022 (Figure 20.2).
- Daily estimated cases in the **antiviral access scenario** will rise to 7,390 by August 22, 2022 (Figure 20.2).

**Hospitalizations**

- Daily hospital census in the **reference scenario** will rise to 3,570 by August 27, 2022 (Figure 20.3). At some point from July through November 1, one country will have high or extreme stress on hospital beds (Figure 22.1). At some point from July through November 1, two countries will have high or extreme stress on intensive care unit (ICU) capacity (Figure 23.1).
- Daily hospital census in the **80% mask use scenario** will rise to 2,270 by July 23, 2022 (Figure 20.3).
- Daily hospital census in the **antiviral access scenario** will rise to 3,570 by August 27, 2022 (Figure 20.3).
Deaths

- In our reference scenario, our model projects 34,000 cumulative reported deaths due to COVID-19 on November 1. This represents 2,700 additional deaths from July 11 to November 1. Daily reported COVID-19 deaths in the reference scenario will rise to 30 by September 7, 2022 (Figure 20.4).
- Under our reference scenario, our model projects 47,000 cumulative total deaths due to COVID-19 on November 1. This represents 3,800 additional deaths from July 11 to November 1 (Figure 20.5).
- In our 80% mask use scenario, our model projects 32,000 cumulative reported deaths due to COVID-19 on November 1. This represents 1,400 additional deaths from July 11 to November 1. Daily reported COVID-19 deaths in the 80% mask use scenario will rise to 30 by July 15, 2022 (Figure 20.4).
- In our antiviral access scenario, our model projects 33,000 cumulative reported deaths due to COVID-19 on November 1. This represents 2,500 additional deaths from July 11 to November 1. Daily reported COVID-19 deaths in the antiviral access scenario will rise to 30 by September 7, 2022 (Figure 20.4).
- Figure 21.1 compares our reference scenario forecasts to other publicly archived models. Forecasts are widely divergent.
Model updates

This month, we have made two alterations to our reference scenario assumptions and one alteration to our antiviral scenario assumptions in the model. First, in the reference scenario, we included an estimate for an additional vaccination dose (second booster). As was previously done with the first booster, we assumed 80% of those who are fully vaccinated (two doses for most vaccines, or one dose for Johnson & Johnson), receive an additional dose six months after becoming fully vaccinated. In this model, we assume 80% of those who receive an additional dose (first booster) receive a second additional dose (second booster) 4-6 months later. Distribution assumptions were time-corrected based on reported data. We estimated each vaccination course using the doses administered in the previous course, taking into account the number of doses available based on manufacturer distribution data. We updated this process to estimate supply and demand on a daily basis rather than periodically.

Second, we expect the recent rollout of Paxlovid treatments in high-income settings to greatly reduce severe disease and death outcomes. We only currently have data from the United States to inform levels of antiviral coverage and have used these data to update our scale-up model from last month. The model assumes individuals in high-income countries had been targeted for treatment, and access to treatment among this group had risen from 0% on March 15, 2022, to a maximum of 80% for high-risk individuals and 50% for low-risk individuals by June 1, 2022. This rollout assumption follows a similar pattern to global vaccine rollouts. Clinical trials suggest that Paxlovid provides an 88% reduction in the risk of hospitalization and death among people treated within five days of symptom onset. We made an additional assumption that if roughly 70% of deaths and 50% of admissions are incidental (defined as patients who test positive for COVID after being admitted to the hospital for other reasons), Paxlovid effectiveness among patients admitted primarily for COVID treatment would be 25-30% for deaths and 40-50% for admissions.

Lastly, we have made one alteration to our antiviral scenario assumptions in the model. Our scale-up model assumes that global distribution of antivirals will extend to all low- and middle-income countries between August 15, 2022, and September 15, 2022. Similar to the reference scenario, we assume a linear scale-up to a maximum of 80% access for high-risk individuals and 50% for low-risk individuals during this time frame.

Cumulative COVID-19 deaths per 100,000 on July 11, 2022

Figure 5.1: Reported cumulative COVID-19 deaths per 100,000

Figure 5.2: Total cumulative COVID-19 deaths per 100,000
Figure 6.1: Estimated percent of the population infected with COVID-19 on July 11, 2022

Figure 7.1: Mean effective R on June 30, 2022. Effective R less than 1 means that transmission should decline, all other things being held the same. The estimate of effective R is based on the combined analysis of deaths, case reporting, and hospitalizations where available. Current reported cases reflect infections 11-13 days prior, so estimates of effective R can only be made for the recent past.

Figure 20.4: Reported daily COVID-19 deaths per 100,000

The graph shows the reported daily COVID-19 deaths per 100,000 population in Thailand from February 2020 to December 2022. The data is divided into three scenarios:

- **Reference**: Green line
- **Antiviral access**: Red line
- **80% mask use**: Purple line

The graph highlights periods of high and low daily deaths, illustrating the impact of public health interventions.
Figure 20.5: Total daily COVID-19 deaths per 100,000

- **Reference**
- **Antiviral access**
- **80% mask use**
Figure 21.1: Comparison of reference model projections with other COVID modeling groups. For this comparison, we are including projections of daily COVID-19 deaths from other modeling groups when available, last model update in brackets: Delphi from the Massachusetts Institute of Technology (Delphi) [July 18, 2022]. Regional values are aggregates from available locations in that region.
Figure 22.1: The estimated inpatient hospital usage is shown over time. The percent of hospital beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of beds occupied by COVID-19 patients. Less than 5% is considered low stress, 5-9% is considered moderate stress, 10-19% is considered high stress, and 20% or greater is considered extreme stress.
Figure 23.1: The estimated intensive care unit (ICU) usage is shown over time. The percent of ICU beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of ICU beds occupied by COVID-19 patients. Less than 10% is considered low stress, 10-29% is considered moderate stress, 30-59% is considered high stress, and 60% or greater is considered extreme stress.
More information

Data sources:
Mask use and vaccine confidence data are from the The Delphi Group at Carnegie Mellon University and University of Maryland COVID-19 Trends and Impact Surveys, in partnership with Facebook. Mask use data are also from Premise, the Kaiser Family Foundation, and the YouGov COVID-19 Behaviour Tracker survey. Genetic sequence and metadata are primarily from the GISAID Initiative. Further details available on the COVID-19 model FAQ page.

A note of thanks:
We wish to warmly acknowledge the support of these and others who have made our COVID-19 estimation efforts possible.
