COVID-19 Results Briefing

Thailand

February 18, 2022

This document contains summary information on the latest projections from the IHME model on COVID-19 in Thailand. The model was run on February 17, 2022, with data through February 14, 2022.

Current situation

- Daily infections in the last week increased to 412,000 per day on average compared to 339,000 the week before (Figure 1.1). Daily hospital census in the last week (through February 14) increased to 6,900 per day on average compared to 5,100 the week before.
- Daily reported cases in the last week increased to 15,000 per day on average compared to 9,800 the week before (Figure 2.1).
- Reported deaths due to COVID-19 in the last week increased to 23 per day on average compared to 20 the week before (Figure 3.1).
- Total deaths due to COVID-19 in the last week increased to 30 per day on average compared to 26 the week before (Figure 3.1). This makes COVID-19 the number 13 cause of death in Thailand this week (Table 1). Estimated total daily deaths due to COVID-19 in the past week were 1.3 times larger than the reported number of deaths.
- The daily rate of reported deaths due to COVID-19 is greater than 4 per million in no countries (Figure 4.1).
- The daily rate of total deaths due to COVID-19 is greater than 4 per million in no countries (Figure 4.2).
- We estimate that 29% of people in Thailand have been infected at least once as of February 14 (Figure 6.1). Effective R, computed using cases, hospitalizations, and deaths, is greater than 1 in five countries. Effective R in Thailand was 1.3 on February 3 (Figure 7.1).
- The infection-detection rate in Thailand was close to 6% on February 14 (Figure 8.1).

Trends in drivers of transmission

- Mobility last week was 6% lower than the pre-COVID-19 baseline (Figure 11.1). Mobility was lower than 30% of baseline in one country and 0 subnational locations in the region.
- As of February 14, in the COVID-19 Trends and Impact Survey, 79% of people self-report that they always wore a mask when leaving their home compared to 79% last week (Figure 13.1).
- There were 81 diagnostic tests per 100,000 people on February 14 (Figure 15.1).
- As of February 14, five countries have reached 70% or more of the population who have received at least one vaccine dose, and two countries have reached 70% or more of the population who are fully vaccinated (Figure 17.1). 80% of people in Thailand have received at least one vaccine dose, and 70% are fully vaccinated.
- In Thailand, 91.7% of the population that is 12 years and older say they would accept, or would probably accept, a vaccine for COVID-19. Note that vaccine acceptance is calculated using survey data from the 18+ population. This is up by 0.1 percentage points from last week. The proportion of the population who are open to receiving a COVID-19 vaccine ranges from 66% in Timor-Leste to 100% in Bhutan (Figure 19.1).
- In our current reference scenario, we expect that 61.4 million people will be vaccinated with at least one dose by June 1 (Figure 20.1). We expect that 82% of the population will be fully vaccinated by June 1.
Projections and scenarios

We produce three scenarios when projecting COVID-19. The **reference scenario** is our forecast of what we think is most likely to happen:

- Vaccines are distributed at the expected pace. Brand- and variant-specific vaccine efficacy is updated using the latest available information from peer-reviewed publications and other reports.
- Future mask use is the mean of mask use over the last seven days.
- Mobility increases as vaccine coverage increases.
- Omicron variant spreads according to our flight and local spread model.
- 80% of those who have had two doses of vaccine (or one dose for Johnson & Johnson) receive a third dose at six months after their second dose.

The **80% mask use scenario** makes all the same assumptions as the reference scenario but assumes all locations reach 80% mask use within seven days. If a location currently has higher than 80% use, mask use remains at the current level.

The **third dose scenario** is the same as the reference scenario but assumes that 100% of those who have received two doses of vaccine will get a third dose at six months.

Projections

Infections

- Daily estimated infections in the **reference scenario** will rise to 444,500 by February 19, 2022 (Figure 22.1).
- Daily estimated infections in the **80% mask use scenario** will rise to 442,960 by February 19, 2022 (Figure 22.1).
- Daily estimated infections in the **third dose scenario** will rise to 441,330 by February 19, 2022 (Figure 22.1).

Cases

- Daily estimated cases in the **reference scenario** will rise to 35,080 by March 11, 2022 (Figure 22.2).
- Daily estimated cases in the **80% mask use scenario** will rise to 34,760 by March 10, 2022 (Figure 22.2).
- Daily estimated cases in the **third dose scenario** will rise to 34,460 by March 10, 2022 (Figure 22.2).

Hospitalizations

- Daily hospital census in the **reference scenario** will rise to 12,200 by March 6, 2022 (Figure 22.3).
- Daily hospital census in the **80% mask use scenario** will rise to 12,170 by March 5, 2022 (Figure 22.3).
- Daily hospital census in the **third dose scenario** will rise to 12,000 by March 5, 2022 (Figure 22.3).

Deaths

- In our **reference scenario**, our model projects 27,000 cumulative reported deaths due to COVID-19 on June 1. This represents 4,100 additional deaths from February 14 to June 1. Daily reported COVID-19 deaths in the **reference scenario** will rise to 80 by March 16, 2022 (Figure 22.4).
- Under our **reference scenario**, our model projects 34,000 cumulative total deaths due to COVID-19 on June 1. This represents 5,300 additional deaths from February 14 to June 1 (Figure 25.2).
- In our **80% mask use scenario**, our model projects 27,000 cumulative reported deaths due to COVID-19 on June 1. This represents 4,100 additional deaths from February 14 to June 1. Daily reported COVID-19 deaths in the **80% mask use scenario** will rise to 80 by March 15, 2022 (Figure 22.4).
• In our **third dose scenario**, our model projects 26,000 cumulative reported deaths due to COVID-19 on June 1. This represents 3,900 additional deaths from February 14 to June 1. Daily reported COVID-19 deaths in the **third dose scenario** will rise to 80 by March 14, 2022 (Figure 22.4).

• Figure 23.1 compares our reference scenario forecasts to other publicly archived models. Forecasts are widely divergent.

• At some point from February through June 1, 7 countries will have high or extreme stress on hospital beds (Figure 24.1). At some point from February through June 1, 7 countries will have high or extreme stress on intensive care unit (ICU) capacity (Figure 25.1).
Model updates

No model updates.

Figure 5.2: Total cumulative COVID-19 deaths per 100,000
Figure 6.1: Estimated percent of the population infected with COVID-19 on February 14, 2022

Figure 7.1: Mean effective R on February 3, 2022. Effective R less than 1 means that transmission should decline, all other things being held the same. The estimate of effective R is based on the combined analysis of deaths, case reporting, and hospitalizations where available. Current reported cases reflect infections 11-13 days prior, so estimates of effective R can only be made for the recent past.
Figure 8.1: Percent of estimated COVID-19 infections detected. This is estimated as the ratio of reported daily COVID-19 cases to estimated daily COVID-19 infections based on the SEIR disease transmission model. Due to measurement errors in cases and testing rates, the infection-detection rate can exceed 100% at particular points in time.

Figure 22.4: Reported daily COVID-19 deaths per 100,000
Figure 22.5: Total daily COVID-19 deaths per 100,000
Figure 23.1: Comparison of reference model projections with other COVID modeling groups. For this comparison, we are including projections of daily COVID-19 deaths from other modeling groups when available, last model update in brackets: Delphi from the Massachusetts Institute of Technology (Delphi) [February 17, 2022], Imperial College London (Imperial) [January 2, 2022], the SI-KJalpha model from the University of Southern California (SIKJalpha) [February 17, 2022]. Daily deaths from other modeling groups are smoothed to remove inconsistencies with rounding. Regional values are aggregates from available locations in that region.
Figure 24.1: The estimated inpatient hospital usage is shown over time. The percent of hospital beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of beds occupied by COVID-19 patients. Less than 5% is considered low stress, 5-9% is considered moderate stress, 10-19% is considered high stress, and 20% or greater is considered extreme stress.
Figure 25.1: The estimated intensive care unit (ICU) usage is shown over time. The percent of ICU beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of ICU beds occupied by COVID-19 patients. Less than 10% is considered low stress, 10-29% is considered moderate stress, 30-59% is considered high stress, and 60% or greater is considered extreme stress.
More information

Data sources:
Mask use and vaccine confidence data are from the The Delphi Group at Carnegie Mellon University and University of Maryland COVID-19 Trends and Impact Surveys, in partnership with Facebook. Mask use data are also from Premise, the Kaiser Family Foundation, and the YouGov COVID-19 Behaviour Tracker survey.

Genetic sequence and metadata are primarily from the GISAID Initiative. Further details available on the COVID-19 model FAQ page.

A note of thanks:
We wish to warmly acknowledge the support of these and others who have made our COVID-19 estimation efforts possible.
