COVID-19 Results Briefing
Viet Nam
May 5, 2022

This document contains summary information on the latest projections from the IHME model on COVID-19 in Viet Nam. The model was run on May 5, 2022, with data through May 2, 2022.

Current situation

- Daily infections in the last week decreased to 25,000 per day on average compared to 41,000 the week before (Figure 1.1). Daily hospital census in the last week (through May 2) decreased to 1,300 per day on average compared to 2,400 the week before.
- Daily reported cases in the last week decreased to 11,000 per day on average compared to 18,000 the week before (Figure 2.1).
- Reported deaths due to COVID-19 in the last week decreased to four per day on average compared to nine the week before (Figure 3.1).
- Total deaths due to COVID-19 in the last week decreased to nine per day on average compared to 18 the week before (Figure 3.1). This makes COVID-19 the number 31 cause of death in Viet Nam this week (Table 1). Estimated total daily deaths due to COVID-19 in the past week were 1.9 times larger than the reported number of deaths.
- The daily rate of reported deaths due to COVID-19 is greater than 4 per million in no countries (Figure 4.1).
- The daily rate of total deaths due to COVID-19 is greater than 4 per million in no countries (Figure 4.2).
- We estimate that 67% of people in Viet Nam have been infected at least once as of May 2 (Figure 6.1). Effective R, computed using cases, hospitalizations, and deaths, is greater than 1 in three countries and 11 subnational locations. Effective R in Viet Nam was 0.7 on April 21 (Figure 7.1).
- The infection-detection rate in Viet Nam was close to 32% on May 2 (Figure 8.1).
- Based on the GISAID and various national databases, combined with our variant spread model, we estimate the current prevalence of variants of concern (Figures 9.1-9.5). We estimate that the Alpha variant is circulating in eight countries and no subnational locations, that the Beta variant is circulating in six countries and no subnational locations, that the Delta variant is circulating in 15 countries and three subnational locations, that the Gamma variant is circulating in three countries and no subnational locations, and that the Omicron variant is circulating in 15 countries and 31 subnational locations.

Trends in drivers of transmission

- Mobility last week was 23% lower than the pre-COVID-19 baseline (Figure 11.1). Mobility was lower than 15% of baseline in three countries (Figure 12.1).
- As of April 24, in the COVID-19 Trends and Impact Survey, 65% of people self-reported that they always wore a mask when leaving their home compared to 65% the previous week (Figure 13.1).
- There were 43 diagnostic tests per 100,000 people on May 2 (Figure 15.1).
- As of May 2, 18 countries and 33 subnational locations have reached 70% or more of the population who have received at least one vaccine dose, and 14 countries and 32 subnational locations have reached 70% or more of the population who are fully vaccinated (Figures 17.1 and 17.2). 81% of people in Viet Nam have received at least one vaccine dose, and 76% are fully vaccinated.
- In Viet Nam, 99.4% of the population that is 12 years and older say they would accept a vaccine for COVID-19 (Figure 18.1). This is the same as last week. Note that vaccine acceptance is calculated using survey data from the 18+ population. The proportion of the population who are open to receiving a COVID-19 vaccine ranges from 45% in Papua New Guinea to 100% in Lao People’s Democratic Republic (Figure 19.1).
- As of April 25, 2022, 0.3 percent of the population in Viet Nam say they would accept a vaccine for COVID-19 but have not yet been vaccinated.
In our current reference scenario, we expect that 77.8 million people will be vaccinated with at least one dose by September 1 (Figure 21.1). We expect that 76% of the population will be fully vaccinated by September 1.

Projections and scenarios

We produce three scenarios when projecting COVID-19. The reference scenario is our forecast of what we think is most likely to happen:

- Vaccines are distributed at the expected pace. Brand- and variant-specific vaccine efficacy is updated using the latest available information from peer-reviewed publications and other reports.
- Future mask use is the mean of mask use over the last seven days.
- Mobility increases as vaccine coverage increases.
- Omicron variant spreads according to our flight and local spread model.
- 80% of those who have had two doses of vaccine (or one dose for Johnson & Johnson) receive a third dose at six months after their second dose.

The 80% mask use scenario makes all the same assumptions as the reference scenario but assumes all locations reach 80% mask use within seven days. If a location currently has higher than 80% use, mask use remains at the current level.

The third dose scenario is the same as the reference scenario but assumes that 100% of those who have received two doses of vaccine will get a third dose at six months.

Projections

Infections

- Daily estimated infections in the reference scenario will decline to 870 by August 14, 2022 (Figure 23.1).
- Daily estimated infections in the 80% mask use scenario will decline to 410 by August 21, 2022 (Figure 23.1).
- Daily estimated infections in the third dose scenario will decline to 870 by August 14, 2022 (Figure 23.1).

Cases

- Daily estimated cases in the reference scenario will decline to 190 by August 26, 2022 (Figure 23.2).
- Daily estimated cases in the 80% mask use scenario will decline to 90 by September 1, 2022 (Figure 23.2).
- Daily estimated cases in the third dose scenario will decline to 190 by August 26, 2022 (Figure 23.2).

Hospitalizations

- Daily hospital census in the reference scenario will decline to 10 by August 31, 2022 (Figure 23.3).
- Daily hospital census in the 80% mask use scenario will decline to 10 by September 1, 2022 (Figure 23.3).
- Daily hospital census in the third dose scenario will decline to 10 by August 31, 2022 (Figure 23.3).

Deaths

- In our reference scenario, our model projects 43,000 cumulative reported deaths due to COVID-19 on September 1. This represents 100 additional deaths from May 2 to September 1. Daily reported COVID-19 deaths in the reference scenario will decline to zero by September 1, 2022 (Figure 23.4).
- Under our reference scenario, our model projects 83,000 cumulative total deaths due to COVID-19 on September 1. This represents 190 additional deaths from May 2 to September 1 (Figure 23.5).
• In our **80% mask use scenario**, our model projects 43,000 cumulative reported deaths due to COVID-19 on September 1. This represents 93 additional deaths from May 2 to September 1. Daily reported COVID-19 deaths in the **80% mask use scenario** will decline to zero by September 1, 2022 (Figure 23.4).

• In our **third dose scenario**, our model projects 43,000 cumulative reported deaths due to COVID-19 on September 1. This represents 100 additional deaths from May 2 to September 1. Daily reported COVID-19 deaths in the **third dose scenario** will decline to zero by September 1, 2022 (Figure 23.4).

• Figure 24.1 compares our reference scenario forecasts to other publicly archived models. Forecasts are widely divergent.

• At some point from May through September 1, one country will have high or extreme stress on hospital beds (Figure 25.1). At some point from May through September 1, four countries will have high or extreme stress on intensive care unit (ICU) capacity (Figure 26.1).

Figure 4.2: Daily total COVID-19 death rate per 1 million
Cumulative COVID-19 deaths per 100,000 on May 2, 2022

Figure 5.1: Reported cumulative COVID-19 deaths per 100,000

Figure 5.2: Total cumulative COVID-19 deaths per 100,000
Figure 6.1: Estimated percent of the population infected with COVID-19 on May 2, 2022

Figure 7.1: Mean effective R on April 21, 2022. Effective R less than 1 means that transmission should decline, all other things being held the same. The estimate of effective R is based on the combined analysis of deaths, case reporting, and hospitalizations where available. Current reported cases reflect infections 11-13 days prior, so estimates of effective R can only be made for the recent past.
Figure 8.1: Percent of estimated COVID-19 infections detected. This is estimated as the ratio of reported daily COVID-19 cases to estimated daily COVID-19 infections based on the SEIR disease transmission model. Due to measurement errors in cases and testing rates, the infection-detection rate can exceed 100% at particular points in time.
Estimated percent of circulating SARS-CoV-2 for primary variant families on May 2, 2022

Figure 23.3: Daily COVID-19 hospital census until September 01, 2022 for three scenarios
Figure 23.4: Reported daily COVID-19 deaths per 100,000
Figure 23.5: Total daily COVID-19 deaths per 100,000
Figure 24.1: Comparison of reference model projections with other COVID modeling groups. For this comparison, we are including projections of daily COVID-19 deaths from other modeling groups when available, last model update in brackets: Delphi from the Massachusetts Institute of Technology (Delphi) [May 2, 2022], and the SI-KJalpha model from the University of Southern California (SIKJalpha) [May 2, 2022]. Regional values are aggregates from available locations in that region.
**Figure 25.1:** The estimated inpatient hospital usage is shown over time. The percent of hospital beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of beds occupied by COVID-19 patients. Less than 5% is considered *low stress*, 5-9% is considered *moderate stress*, 10-19% is considered *high stress*, and 20% or greater is considered *extreme stress*.
Figure 26.1: The estimated intensive care unit (ICU) usage is shown over time. The percent of ICU beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of ICU beds occupied by COVID-19 patients. Less than 10% is considered low stress, 10-29% is considered moderate stress, 30-59% is considered high stress, and 60% or greater is considered extreme stress.
More information

Data sources:
Mask use and vaccine confidence data are from the The Delphi Group at Carnegie Mellon University and University of Maryland COVID-19 Trends and Impact Surveys, in partnership with Facebook. Mask use data are also from Premise, the Kaiser Family Foundation, and the YouGov COVID-19 Behaviour Tracker survey.

Genetic sequence and metadata are primarily from the GISAID Initiative. Further details available on the COVID-19 model FAQ page.

A note of thanks:
We wish to warmly acknowledge the support of these and others who have made our COVID-19 estimation efforts possible.
