COVID-19 Results Briefing
Viet Nam
March 21, 2022

This document contains summary information on the latest projections from the IHME model on COVID-19 in Viet Nam. The model was run on March 20, 2022, with data through March 11, 2022.

Current situation
- Daily infections in the last week decreased to 1,351,000 per day on average compared to 1,509,000 the week before (Figure 1.1). Daily hospital census in the last week (through March 11) increased to 22,000 per day on average compared to 16,000 the week before.
- Daily reported cases in the last week increased to 183,000 per day on average compared to 121,000 the week before (Figure 2.1).
- Reported deaths due to COVID-19 in the last week increased to 110 per day on average compared to 93 the week before (Figure 3.1).
- Total deaths due to COVID-19 in the last week increased to 200 per day on average compared to 180 the week before (Figure 3.1). This makes COVID-19 the number three cause of death in Viet Nam this week (Table 1). Estimated total daily deaths due to COVID-19 in the past week were 1.9 times larger than the reported number of deaths.
- The daily rate of reported deaths due to COVID-19 is greater than 4 per million in one country (Figure 4.1).
- The daily rate of total deaths due to COVID-19 is greater than 4 per million in two countries (Figure 4.2).
- We estimate that 57% of people in Viet Nam have been infected at least once as of March 14 (Figure 6.1). Effective R, computed using cases, hospitalizations, and deaths, is greater than 1 in five countries. Effective R in Viet Nam was 1.1 on March 3 (Figure 7.1).
- The infection-detection rate in Viet Nam was close to 14% on March 14 (Figure 8.1).
- Based on the GISAID and various national databases, combined with our variant spread model, we estimate the current prevalence of variants of concern (Figures 9.1-9.5). We estimate that the Alpha variant is circulating in eight countries, that the Beta variant is circulating in six countries, that the Delta variant is circulating in 13 countries, that the Gamma variant is circulating in three countries, and that the Omicron variant is circulating in 13 countries.

Trends in drivers of transmission
- Mobility last week was 8% lower than the pre-COVID-19 baseline (Figure 11.1). Mobility was lower than 30% of baseline in no countries.
- As of March 14, in the COVID-19 Trends and Impact Survey, 71% of people self-report that they always wore a mask when leaving their home compared to 70% last week (Figure 13.1).
- There were 55 diagnostic tests per 100,000 people on March 14 (Figure 15.1).
- As of March 14, 16 countries have reached 70% or more of the population who have received at least one vaccine dose, and 12 countries have reached 70% or more of the population who are fully vaccinated (Figure 17.1). 81% of people in Viet Nam have received at least one vaccine dose, and 76% are fully vaccinated.
- In Viet Nam, 99.7% of the population that is 12 years and older say they would accept, or would probably accept, a vaccine for COVID-19. Note that vaccine acceptance is calculated using survey data from the 18+ population. This is up by 0.1 percentage points from last week. The proportion of the population who are open to receiving a COVID-19 vaccine ranges from 29% in Mongolia to 100% in Viet Nam (Figure 19.1).
- In our current reference scenario, we expect that 77.8 million people will be vaccinated with at least one dose by July 1 (Figure 20.1). We expect that 76% of the population will be fully vaccinated by July 1.
Projections and scenarios

We produce three scenarios when projecting COVID-19. The reference scenario is our forecast of what we think is most likely to happen:

- Vaccines are distributed at the expected pace. Brand- and variant-specific vaccine efficacy is updated using the latest available information from peer-reviewed publications and other reports.
- Future mask use is the mean of mask use over the last seven days.
- Mobility increases as vaccine coverage increases.
- Omicron variant spreads according to our flight and local spread model.
- 80% of those who have had two doses of vaccine (or one dose for Johnson & Johnson) receive a third dose at six months after their second dose.

The 80% mask use scenario makes all the same assumptions as the reference scenario but assumes all locations reach 80% mask use within seven days. If a location currently has higher than 80% use, mask use remains at the current level.

The third dose scenario is the same as the reference scenario but assumes that 100% of those who have received two doses of vaccine will get a third dose at six months.

Projections

Infections

- Daily estimated infections in the reference scenario will decline to 4,180 by July 1, 2022 (Figure 22.1).
- Daily estimated infections in the 80% mask use scenario will decline to 3,760 by July 1, 2022 (Figure 22.1).
- Daily estimated infections in the third dose scenario will decline to 1,690 by July 1, 2022 (Figure 22.1).

Cases

- Daily estimated cases in the reference scenario will decline to 390 by July 1, 2022 (Figure 22.2).
- Daily estimated cases in the 80% mask use scenario will decline to 350 by July 1, 2022 (Figure 22.2).
- Daily estimated cases in the third dose scenario will decline to 190 by July 1, 2022 (Figure 22.2).

Hospitalizations

- Daily hospital census in the reference scenario will rise to 25,730 by March 20, 2022 (Figure 22.3).
- Daily hospital census in the 80% mask use scenario will rise to 25,730 by March 20, 2022 (Figure 22.3).
- Daily hospital census in the third dose scenario will rise to 24,320 by March 19, 2022 (Figure 22.3).

Deaths

- In our reference scenario, our model projects 54,000 cumulative reported deaths due to COVID-19 on July 1. This represents 13,000 additional deaths from March 14 to July 1. Daily reported COVID-19 deaths in the reference scenario will rise to 350 by April 3, 2022 (Figure 22.4).
- Under our reference scenario, our model projects 104,000 cumulative total deaths due to COVID-19 on July 1. This represents 24,000 additional deaths from March 14 to July 1 (Figure 22.5).
- In our 80% mask use scenario, our model projects 54,000 cumulative reported deaths due to COVID-19 on July 1. This represents 13,000 additional deaths from March 14 to July 1. Daily reported COVID-19 deaths in the 80% mask use scenario will rise to 350 by April 3, 2022 (Figure 22.4).
- In our third dose scenario, our model projects 54,000 cumulative reported deaths due to COVID-19 on July 1. This represents 12,000 additional deaths from March 14 to July 1. Daily reported COVID-19 deaths in the third dose scenario will rise to 330 by April 3, 2022 (Figure 22.4).
Figure 23.1 compares our reference scenario forecasts to other publicly archived models. Forecasts are widely divergent.

At some point from March through July 1, three countries will have high or extreme stress on hospital beds (Figure 24.1). At some point from March through July 1, eight countries will have high or extreme stress on intensive care unit (ICU) capacity (Figure 25.1).
Model updates

We had previously developed a model in which deaths and the infection-fatality ratio, hospital admissions and the infection-hospitalization ratio, and cases and the infection-detection ratio were all passed into a single run of our ODE system to simultaneously fit past transmission intensity for a given location over time. We have seen improved stability when we instead first derive transmission intensity based on each of the three aforementioned pairs of daily reported epi statistics and estimated ratios in separate SEIR models and then average them.

Figure 4.2: Daily total COVID-19 death rate per 1 million
Cumulative COVID-19 deaths per 100,000 on March 14, 2022

Figure 5.1: Reported cumulative COVID-19 deaths per 100,000

Figure 5.2: Total cumulative COVID-19 deaths per 100,000
Figure 6.1: Estimated percent of the population infected with COVID-19 on March 14, 2022

Figure 7.1: Mean effective R on March 3, 2022. Effective R less than 1 means that transmission should decline, all other things being held the same. The estimate of effective R is based on the combined analysis of deaths, case reporting, and hospitalizations where available. Current reported cases reflect infections 11-13 days prior, so estimates of effective R can only be made for the recent past.
Figure 8.1: Percent of estimated COVID-19 infections detected. This is estimated as the ratio of reported daily COVID-19 cases to estimated daily COVID-19 infections based on the SEIR disease transmission model. Due to measurement errors in cases and testing rates, the infection-detection rate can exceed 100% at particular points in time.

Figure 22.4: Reported daily COVID-19 deaths per 100,000
Figure 22.5: Total daily COVID-19 deaths per 100,000
Figure 23.1: Comparison of reference model projections with other COVID modeling groups. For this comparison, we are including projections of daily COVID-19 deaths from other modeling groups when available, last model update in brackets: Delphi from the Massachusetts Institute of Technology (Delphi) [March 20, 2022], Imperial College London (Imperial) [January 20, 2022], the SI-KJalpha model from the University of Southern California (SIKJalpha) [March 20, 2022]. Daily deaths from other modeling groups are smoothed to remove inconsistencies with rounding. Regional values are aggregates from available locations in that region.
Figure 24.1: The estimated inpatient hospital usage is shown over time. The percent of hospital beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of beds occupied by COVID-19 patients. Less than 5% is considered low stress, 5-9% is considered moderate stress, 10-19% is considered high stress, and 20% or greater is considered extreme stress.
Figure 25.1: The estimated intensive care unit (ICU) usage is shown over time. The percent of ICU beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of ICU beds occupied by COVID-19 patients. Less than 10% is considered low stress, 10-29% is considered moderate stress, 30-59% is considered high stress, and 60% or greater is considered extreme stress.
More information

Data sources:
Mask use and vaccine confidence data are from the The Delphi Group at Carnegie Mellon University and University of Maryland COVID-19 Trends and Impact Surveys, in partnership with Facebook. Mask use data are also from Premise, the Kaiser Family Foundation, and the YouGov COVID-19 Behaviour Tracker survey. Genetic sequence and metadata are primarily from the GISAID Initiative. Further details available on the COVID-19 model FAQ page.

A note of thanks:
We wish to warmly acknowledge the support of these and others who have made our COVID-19 estimation efforts possible.
