COVID-19 Results Briefing

Cyprus

April 8, 2022

This document contains summary information on the latest projections from the IHME model on COVID-19 in Cyprus. The model was run on April 7, 2022, with data through April 4, 2022.

Current situation

- Daily infections in the last week decreased to 4,000 per day on average compared to 4,600 the week before (Figure 1.1). Daily hospital census in the last week (through April 4) increased to 190 per day on average compared to 170 the week before.
- Daily reported cases in the last week decreased to 4,200 per day on average compared to 4,700 the week before (Figure 2.1).
- Reported deaths due to COVID-19 in the last week remained the same at two per day on average compared to the week before (Figure 3.1).
- Total deaths due to COVID-19 in the last week remained the same at three per day on average compared to the week before (Figure 3.1). This makes COVID-19 the number two cause of death in Cyprus this week (Table 1). Estimated total daily deaths due to COVID-19 in the past week were 1.2 times larger than the reported number of deaths.
- The daily rate of reported deaths due to COVID-19 is greater than 4 per million in four countries (Figure 4.1).
- The daily rate of total deaths due to COVID-19 is greater than 4 per million in 16 countries (Figure 4.2).
- We estimate that 48% of people in Cyprus have been infected at least once as of April 4 (Figure 6.1). Effective R, computed using cases, hospitalizations, and deaths, is greater than 1 in eight countries and 15 subnational locations. Effective R in Cyprus was 0.9 on March 24 (Figure 7.1).
- The infection-detection rate in Cyprus was close to 78% on April 4 (Figure 8.1).
- Based on the GISAID and various national databases, combined with our variant spread model, we estimate the current prevalence of variants of concern (Figures 9.1-9.5). We estimate that the Alpha variant is circulating in 51 countries and 59 subnational locations, that the Beta variant is circulating in 29 countries and 13 subnational locations, that the Delta variant is circulating in 51 countries and 60 subnational locations, that the Gamma variant is circulating in 26 countries and 22 subnational locations, and that the Omicron variant is circulating in 51 countries and 60 subnational locations.

Trends in drivers of transmission

- Mobility last week was 9% lower than the pre-COVID-19 baseline (Figure 11.1). Mobility was lower than 15% of baseline in three countries.
- As of April 4, in the COVID-19 Trends and Impact Survey, 56% of people self-report that they always wore a mask when leaving their home compared to 56% last week (Figure 13.1).
- There were 6,893 diagnostic tests per 100,000 people on April 4 (Figure 15.1).
- As of April 4, 23 countries and 56 subnational locations have reached 70% or more of the population who have received at least one vaccine dose, and 20 countries and 53 subnational locations have reached 70% or more of the population who are fully vaccinated (Figure 17.1). 53% of people in Cyprus have received at least one vaccine dose, and 50% are fully vaccinated.
- In Cyprus, 61.5% of the population that is 12 years and older say they would accept a vaccine for COVID-19. Note that vaccine acceptance is calculated using survey data from the 18+ population. This is down by 0.1 percentage points from last week. The proportion of the population who are open to receiving a COVID-19 vaccine ranges from 38% in Republic of Moldova to 99% in Iceland (Figure 19.1).
In our current reference scenario, we expect that 692,300 people will be vaccinated with at least one dose by August 1 (Figure 20.1). We expect that 50% of the population will be fully vaccinated by August 1.

Projections and scenarios

We produce three scenarios when projecting COVID-19. The **reference scenario** is our forecast of what we think is most likely to happen:

- Vaccines are distributed at the expected pace. Brand- and variant-specific vaccine efficacy is updated using the latest available information from peer-reviewed publications and other reports.
- Future mask use is the mean of mask use over the last seven days.
- Mobility increases as vaccine coverage increases.
- Omicron variant spreads according to our flight and local spread model.
- 80% of those who have had two doses of vaccine (or one dose for Johnson & Johnson) receive a third dose at six months after their second dose.

The **80% mask use scenario** makes all the same assumptions as the reference scenario but assumes all locations reach 80% mask use within seven days. If a location currently has higher than 80% use, mask use remains at the current level.

The **third dose scenario** is the same as the reference scenario but assumes that 100% of those who have received two doses of vaccine will get a third dose at six months.

Projections

**Infections**

- Daily estimated infections in the **reference scenario** will decline to 110 by August 1, 2022 (Figure 22.1).
- Daily estimated infections in the **80% mask use scenario** will decline to 50 by August 1, 2022 (Figure 22.1).
- Daily estimated infections in the **third dose scenario** will decline to 110 by August 1, 2022 (Figure 22.1).

**Cases**

- Daily estimated cases in the **reference scenario** will decline to 80 by August 1, 2022 (Figure 22.2).
- Daily estimated cases in the **80% mask use scenario** will decline to 30 by August 1, 2022 (Figure 22.2).
- Daily estimated cases in the **third dose scenario** will decline to 80 by August 1, 2022 (Figure 22.2).

**Hospitalizations**

- Daily hospital census in the **reference scenario** will decline to 10 by August 1, 2022 (Figure 22.3).
- Daily hospital census in the **80% mask use scenario** will decline to zero by August 1, 2022 (Figure 22.3).
- Daily hospital census in the **third dose scenario** will decline to 10 by August 1, 2022 (Figure 22.3).

**Deaths**

- In our **reference scenario**, our model projects 1,100 cumulative reported deaths due to COVID-19 on August 1. This represents 100 additional deaths from April 4 to August 1. Daily reported COVID-19 deaths in the **reference scenario** will rise to zero by April 10, 2022 (Figure 22.4).
- Under our **reference scenario**, our model projects 1,300 cumulative total deaths due to COVID-19 on August 1. This represents 120 additional deaths from April 4 to August 1 (Figure 22.5).
• In our **80% mask use scenario**, our model projects 1,100 cumulative reported deaths due to COVID-19 on August 1. This represents 88 additional deaths from April 4 to August 1. Daily reported COVID-19 deaths in the **80% mask use scenario** will rise to zero by April 10, 2022 (Figure 22.4).

• In our **third dose scenario**, our model projects 1,100 cumulative reported deaths due to COVID-19 on August 1. This represents 100 additional deaths from April 4 to August 1. Daily reported COVID-19 deaths in the **third dose scenario** will rise to zero by April 10, 2022 (Figure 22.4).

• Figure 23.1 compares our reference scenario forecasts to other publicly archived models. Forecasts are widely divergent.

• At some point from April through August 1, no countries will have high or extreme stress on hospital beds (Figure 24.1). At some point from April through August 1, 12 countries will have high or extreme stress on intensive care unit (ICU) capacity (Figure 25.1).
Model updates

Vaccine confidence data are from The Delphi Group at Carnegie Mellon University and University of Maryland COVID-19 Trends and Impact Surveys, in partnership with Facebook. In our previous estimates of the proportion of the population that is 12 years and older who would receive the COVID-19 vaccine if available, we included survey responses of “yes, probably” and “yes, definitely” when asked “If a vaccine to prevent COVID-19 were offered to you today, would you choose to get vaccinated?” In our analysis of vaccine uptake, we have seen that vaccination rates have largely plateaued at the level implied by the “yes, definitely” response level. Therefore, we have updated our estimates of willingness to accept the vaccine to include only survey responses of “yes, definitely.”

Daily COVID-19 death rate per 1 million on April 4, 2022

Figure 4.1: Daily reported COVID-19 death rate per 1 million

Figure 4.2: Daily total COVID-19 death rate per 1 million
Cumulative COVID-19 deaths per 100,000 on April 4, 2022

Figure 5.1: Reported cumulative COVID-19 deaths per 100,000

Figure 5.2: Total cumulative COVID-19 deaths per 100,000
Figure 6.1: Estimated percent of the population infected with COVID-19 on April 4, 2022

Figure 7.1: Mean effective R on March 24, 2022. Effective R less than 1 means that transmission should decline, all other things being held the same. The estimate of effective R is based on the combined analysis of deaths, case reporting, and hospitalizations where available. Current reported cases reflect infections 11-13 days prior, so estimates of effective R can only be made for the recent past.
Figure 8.1: Percent of estimated COVID-19 infections detected. This is estimated as the ratio of reported daily COVID-19 cases to estimated daily COVID-19 infections based on the SEIR disease transmission model. Due to measurement errors in cases and testing rates, the infection-detection rate can exceed 100% at particular points in time.

### Critical drivers

**Table 2: Current mandate implementation**

- **Primary school closure**
- **Secondary school closure**
- **Higher school closure**
- **Entry restrictions for some non-residents**
- **Entry restrictions for all non-residents**
- **Individual movements restricted**
- **Curfew for businesses**
- **Individual curfew**
- **Gathering limit: 6 indoor, 10 outdoor**
- **Gathering limit: 10 indoor, 25 outdoor**
- **Gathering limit: 50 indoor, 100 outdoor**
- **Gathering limit: 100 indoor, 250 outdoor**
- **Restaurants closed**
- **Bars closed**
- **Restaurants / bars closed**
- **Restaurants / bars curbside only**
- **Gyms, pools, other leisure closed**
- **Non-essential retail closed**
- **Non-essential retail curbside only**
- **Non-essential workplaces closed**
- **Stay home order**
- **Stay home fine**
- **Mask mandate**
- **Mask mandate fine**

*Not all locations are measured at the subnational level.*

Figure 22.2: Daily COVID-19 reported cases until August 01, 2022 for three scenarios
Figure 22.3: Daily COVID-19 hospital census until August 01, 2022 for three scenarios
Figure 22.4: Reported daily COVID-19 deaths per 100,000
Figure 22.5: Total daily COVID-19 deaths per 100,000
Figure 23.1: Comparison of reference model projections with other COVID modeling groups.
For this comparison, we are including projections of daily COVID-19 deaths from other modeling groups when available, last model update in brackets: Delphi from the Massachusetts Institute of Technology (Delphi) [April 7, 2022], the SI-KJalpha model from the University of Southern California (SIKJalpha) [April 7, 2022]. Daily deaths from other modeling groups are smoothed to remove inconsistencies with rounding. Regional values are aggregates from available locations in that region.
Figure 24.1: The estimated inpatient hospital usage is shown over time. The percent of hospital beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of beds occupied by COVID-19 patients. Less than 5% is considered low stress, 5-9% is considered moderate stress, 10-19% is considered high stress, and 20% or greater is considered extreme stress.
Figure 25.1: The estimated intensive care unit (ICU) usage is shown over time. The percent of ICU beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of ICU beds occupied by COVID-19 patients. Less than 10% is considered low stress, 10-29% is considered moderate stress, 30-59% is considered high stress, and 60% or greater is considered extreme stress.
More information

Data sources:
Mask use and vaccine confidence data are from the The Delphi Group at Carnegie Mellon University and University of Maryland COVID-19 Trends and Impact Surveys, in partnership with Facebook. Mask use data are also from Premise, the Kaiser Family Foundation, and the YouGov COVID-19 Behaviour Tracker survey.

Genetic sequence and metadata are primarily from the GISAID Initiative. Further details available on the COVID-19 model FAQ page.

A note of thanks:
We wish to warmly acknowledge the support of these and others who have made our COVID-19 estimation efforts possible.
