COVID-19 Results Briefing

Cyprus

June 13, 2022

This document contains summary information on the latest projections from the IHME model on COVID-19 in Cyprus. The model was run on June 8, 2022, with data through June 3, 2022.

Current situation

- Daily infections in the last week decreased to 290 per day on average compared to 300 the week before (Figure 1.1). Daily hospital census in the last week (through June 3) decreased to 10 per day on average compared to 13 the week before.
- Daily reported cases in the last week remained the same at 260 per day on average compared to the week before (Figure 2.1).
- Reported deaths due to COVID-19 in the last week remained the same at zero per day on average compared to the week before (Figure 3.1).
- Total deaths due to COVID-19 in the last week remained the same at zero per day on average compared to the week before (Figure 3.1). This makes COVID-19 the number 29 cause of death in Cyprus this week (Table 1). Estimated total daily deaths due to COVID-19 in the past week were 1.2 times larger than the reported number of deaths.
- The daily rate of reported deaths due to COVID-19 is greater than 4 per million in no countries (Figure 4.1).
- The daily rate of total deaths due to COVID-19 is greater than 4 per million in two countries (Figure 4.2).
- We estimate that 58% of people in Cyprus have been infected at least once as of June 6 (Figure 6.1). Effective R, computed using cases, hospitalizations, and deaths, is greater than 1 in 19 countries and five subnational locations. Effective R in Cyprus was 1.0 on May 26 (Figure 7.1).
- The infection-detection rate in Cyprus was close to 110% on June 6 (Figure 8.1).
- Based on the GISAID and various national databases, combined with our variant spread model, we estimate the current prevalence of variants of concern (Figures 9.1-9.5). We estimate that the Alpha variant is circulating in 51 countries and 59 subnational locations, that the Beta variant is circulating in 29 countries and 13 subnational locations, that the Delta variant is circulating in 51 countries and 60 subnational locations, that the Gamma variant is circulating in 26 countries and 22 subnational locations, and that the Omicron variant is circulating in 51 countries and 60 subnational locations.

Trends in drivers of transmission

- Mobility last week was 2% lower than the pre-COVID-19 baseline (Figure 11.1). Mobility was lower than 15% of baseline in one country (Figure 12.1).
- As of April 15, in the COVID-19 Trends and Impact Survey, 57% of people self-reported that they always wore a mask when leaving their home compared to 56% the previous week (Figure 13.1).
- There were 5,688 diagnostic tests per 100,000 people on June 6 (Figure 15.1).
- As of June 6, 23 countries and 57 subnational locations have reached 70% or more of the population who have received at least one vaccine dose, and 20 countries and 53 subnational locations have reached 70% or more of the population who are fully vaccinated (Figures 17.1 and 17.2). 51% of people in Cyprus have received at least one vaccine dose, and 48% are fully vaccinated.
- In Cyprus, 61.6% of the population that is 12 years and older say they would accept a vaccine for COVID-19 (Figure 18.1). This is up by 0.1 percentage points from last week. In Cyprus, 61.6% of the population that is 12 years and older say they would accept a vaccine for COVID-19 (Figure 18.1). This is up by 0.1 percentage points from last week. The proportion of the population who are open to
receiving a COVID-19 vaccine ranges from 35% in Kyrgyzstan to 99% in Iceland (Figure 19.1). Note that vaccine acceptance is calculated using survey data from the 18+ population.

- As of May 30, 2022, five percent of the population in Cyprus say they would accept a vaccine for COVID-19 but have not yet been vaccinated.
- In our current reference scenario, we expect that 672,400 people will be vaccinated with at least one dose by October 1 (Figure 21.1). We expect that 48% of the population will be fully vaccinated by October 1.

Projections and scenarios

We produce three scenarios when projecting COVID-19. The reference scenario is our forecast of what we think is most likely to happen:

- Vaccines are distributed at the expected pace. Brand- and variant-specific vaccine efficacy is updated using the latest available information from peer-reviewed publications and other reports.
- Future mask use will decline to 50% of the minimum level it reached between January 1, 2021, and May 1, 2022. This decline begins after the last observed data point in each location and transitions linearly to the minimum over a period of six weeks.
- Mobility increases as vaccine coverage increases.
- 80% of those who have had two doses of vaccine (or one dose for Johnson & Johnson) receive a third dose at six months after their second dose.
- Antiviral utilization for COVID-19 risk prevention in high-risk populations will reach 80% between June 15, 2022, and July 31, 2022. This applies in high-income countries, but not low- and middle-income countries, and this rollout assumption follows a similar pattern to global vaccine rollouts.

The 80% mask use scenario makes all the same assumptions as the reference scenario but assumes all locations reach 80% mask use within seven days. If a location currently has higher than 80% use, mask use remains at the current level.

The antiviral access scenario makes all the same assumptions as the reference scenario but assumes globally distributed antivirals and extends coverage to all low- and middle-income countries between August 15, 2022, and September 30, 2022.

Infections

- Daily estimated infections in the reference scenario will rise to 530 by October 1, 2022 (Figure 23.1).
- Daily estimated infections in the 80% mask use scenario will decline to 30 by August 17, 2022 (Figure 23.1).
- Daily estimated infections in the antiviral access scenario will rise to 530 by October 1, 2022 (Figure 23.1).

Cases

- Daily estimated cases in the reference scenario will decline to 120 by July 11, 2022 (Figure 23.2).
- Daily estimated cases in the 80% mask use scenario will decline to 10 by August 31, 2022 (Figure 23.2).
- Daily estimated cases in the antiviral access scenario will decline to 120 by July 11, 2022 (Figure 23.2).

Hospitalizations

- Daily hospital census in the reference scenario will decline to 10 by August 18, 2022 (Figure 23.3). At some point from June through October 1, one country will have high or extreme stress on hospital beds (Figure 25.1). At some point from June through October 1, four countries will have high or extreme stress on intensive care unit (ICU) capacity (Figure 26.1).
• Daily hospital census in the 80% mask use scenario will decline to zero by September 3, 2022 (Figure 23.3).
• Daily hospital census in the antiviral access scenario will decline to 10 by August 18, 2022 (Figure 23.3).

Deaths
• In our reference scenario, our model projects 1,100 cumulative reported deaths due to COVID-19 on October 1. This represents eight additional deaths from June 6 to October 1. Daily reported COVID-19 deaths in the reference scenario will decline to zero by August 27, 2022 (Figure 23.4).
• Under our reference scenario, our model projects 1,300 cumulative total deaths due to COVID-19 on October 1. This represents 10 additional deaths from June 6 to October 1 (Figure 23.5).
• In our 80% mask use scenario, our model projects 1,100 cumulative reported deaths due to COVID-19 on October 1. This represents three additional deaths from June 6 to October 1. Daily reported COVID-19 deaths in the 80% mask use scenario will decline to zero by September 12, 2022 (Figure 23.4).
• In our antiviral access scenario, our model projects 1,100 cumulative reported deaths due to COVID-19 on October 1. This represents eight additional deaths from June 6 to October 1. Daily reported COVID-19 deaths in the antiviral access scenario will decline to zero by August 27, 2022 (Figure 23.4).
• Figure 24.1 compares our reference scenario forecasts to other publicly archived models. Forecasts are widely divergent.
Model updates

This month, we have made three alterations to our reference assumptions in the model. First, we expect the recent rollout of Paxlovid treatments in high-income settings to greatly reduce severe disease and death outcomes. We do not currently have data to inform levels of coverage, so we have introduced a simple scale-up model that assumes individuals over the age of 65 will be targeted for treatment, and access to treatment among this group will rise from 0% on June 15, 2022, to a maximum of 80% on July 31, 2022. Clinical trials suggest a Paxlovid provides an 88% reduction in the risk of hospitalization and death [1] among people treated within five days of symptom onset. We make a slightly more conservative assumption that the hospitalization and death rates will be reduced by 80% to account for variations in treatment timing and patient adherence in a real-world setting.

Second, survey data suggest that mask use is continuing to decline in most world locations. We have updated our reference mask use forecast to introduce a linear decline in mask use prevalence down to 50% of the minimum use level between January 1, 2021, and May 1, 2022, in each location. We have kept our previous assumption that mask use will continue at current levels in China, South Korea, Japan, Taiwan, Singapore, and South Africa, as current data do not suggest an imminent reduction.

Finally, similar to mask use, observed mobility continues to increase in much of the world. We have replaced our previous reference scenario that assumed current levels of mobility would persist indefinitely with a scenario that has mobility increase to match vaccine coverage. We continue to produce three scenarios when projecting COVID-19, but we have replaced the increased booster coverage scenario with an antiviral access scenario that examines the impact of more equitable distribution of Paxlovid to low- and middle-income countries (LMICs).

Figure 6.1: Estimated percent of the population infected with COVID-19 on June 6, 2022

Figure 7.1: Mean effective R on May 26, 2022. Effective R less than 1 means that transmission should decline, all other things being held the same. The estimate of effective R is based on the combined analysis of deaths, case reporting, and hospitalizations where available. Current reported cases reflect infections 11-13 days prior, so estimates of effective R can only be made for the recent past.
**Figure 8.1: Percent of estimated COVID-19 infections detected.** This is estimated as the ratio of reported daily COVID-19 cases to estimated daily COVID-19 infections based on the SEIR disease transmission model. Due to measurement errors in cases and testing rates, the infection-detection rate can exceed 100% at particular points in time.

Figure 23.2: Daily COVID-19 reported cases until October 01, 2022 for three scenarios
Figure 23.3: Daily COVID-19 hospital census until October 01, 2022 for three scenarios
Figure 23.4: Reported daily COVID-19 deaths per 100,000
Figure 23.5: Total daily COVID-19 deaths per 100,000
Figure 24.1: Comparison of reference model projections with other COVID modeling groups. For this comparison, we are including projections of daily COVID-19 deaths from other modeling groups when available, last model update in brackets: Delphi from the Massachusetts Institute of Technology (Delphi) [May 29, 2022], and the SI-KJalpha model from the University of Southern California (SIKJalpha) [June 10, 2022]. Regional values are aggregates from available locations in that region.
Figure 25.1: The estimated inpatient hospital usage is shown over time. The percent of hospital beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of beds occupied by COVID-19 patients. Less than 5% is considered low stress, 5-9% is considered moderate stress, 10-19% is considered high stress, and 20% or greater is considered extreme stress.
Figure 26.1: The estimated intensive care unit (ICU) usage is shown over time. The percent of ICU beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of ICU beds occupied by COVID-19 patients. Less than 10% is considered low stress, 10-29% is considered moderate stress, 30-59% is considered high stress, and 60% or greater is considered extreme stress.
Cyprus

More information

Data sources:
Mask use and vaccine confidence data are from the The Delphi Group at Carnegie Mellon University and University of Maryland COVID-19 Trends and Impact Surveys, in partnership with Facebook. Mask use data are also from Premise, the Kaiser Family Foundation, and the YouGov COVID-19 Behaviour Tracker survey.

Genetic sequence and metadata are primarily from the GISAID Initiative. Further details available on the COVID-19 model FAQ page.

A note of thanks:
We wish to warmly acknowledge the support of these and others who have made our COVID-19 estimation efforts possible.
