COVID-19 Results Briefing
Iceland
May 5, 2022

This document contains summary information on the latest projections from the IHME model on COVID-19 in Iceland. The model was run on May 5, 2022, with data through April 29, 2022.

Current situation

- Daily infections in the last week decreased to 72 per day on average compared to 110 the week before (Figure 1.1). Daily hospital census in the last week (through April 29) decreased to 17 per day on average compared to 22 the week before.
- Daily reported cases in the last week decreased to 140 per day on average compared to 260 the week before (Figure 2.1).
- Reported deaths due to COVID-19 in the last week remained the same at one per day on average compared to the week before (Figure 3.1).
- Total deaths due to COVID-19 in the last week remained the same at one per day on average compared to the week before (Figure 3.1). This makes COVID-19 the number two cause of death in Iceland this week (Table 1). Estimated total daily deaths due to COVID-19 in the past week were 1.0 times larger than the reported number of deaths.
- The daily rate of reported deaths due to COVID-19 is greater than 4 per million in one country (Figure 4.1).
- The daily rate of total deaths due to COVID-19 is greater than 4 per million in six countries (Figure 4.2).
- We estimate that 50% of people in Iceland have been infected at least once as of May 2 (Figure 6.1). Effective R, computed using cases, hospitalizations, and deaths, is greater than 1 in 16 countries and 18 subnational locations. Effective R in Iceland was 0.6 on April 21 (Figure 7.1).
- The infection-detection rate in Iceland was close to 52% on May 2 (Figure 8.1).
- Based on the GISAID and various national databases, combined with our variant spread model, we estimate the current prevalence of variants of concern (Figures 9.1-9.5). We estimate that the Alpha variant is circulating in 51 countries and 59 subnational locations, that the Beta variant is circulating in 29 countries and 13 subnational locations, that the Delta variant is circulating in 51 countries and 60 subnational locations, that the Gamma variant is circulating in 26 countries and 22 subnational locations, and that the Omicron variant is circulating in 51 countries and 60 subnational locations.

Trends in drivers of transmission

- Mobility last week was 8% lower than the pre-COVID-19 baseline (Figure 11.1). Mobility was lower than 15% of baseline in one country (Figure 12.1).
- As of March 15, in the COVID-19 Trends and Impact Survey, 43% of people self-reported that they always wore a mask when leaving their home compared to 43% the previous week (Figure 13.1).
- There were 335 diagnostic tests per 100,000 people on May 2 (Figure 15.1).
- As of May 2, 24 countries and 56 subnational locations have reached 70% or more of the population who have received at least one vaccine dose, and 20 countries and 53 subnational locations have reached 70% or more of the population who are fully vaccinated (Figures 17.1 and 17.2). 83% of people in Iceland have received at least one vaccine dose, and 78% are fully vaccinated.
- In Iceland, 99.1% of the population that is 12 years and older say they would accept a vaccine for COVID-19 (Figure 18.1). This is the same as last week. Note that vaccine acceptance is calculated using survey data from the 18+ population. The proportion of the population who are open to receiving a COVID-19 vaccine ranges from 37% in Kyrgyzstan to 99% in Iceland (Figure 19.1).
- As of April 25, 2022, 0.1 percent of the population in Iceland say they would accept a vaccine for COVID-19 but have not yet been vaccinated.
- In our current reference scenario, we expect that 286,300 people will be vaccinated with at least one...
Iceland

dose by September 1 (Figure 21.1). We expect that 78% of the population will be fully vaccinated by September 1.

Projections and scenarios

We produce three scenarios when projecting COVID-19. The reference scenario is our forecast of what we think is most likely to happen:

• Vaccines are distributed at the expected pace. Brand- and variant-specific vaccine efficacy is updated using the latest available information from peer-reviewed publications and other reports.
• Future mask use is the mean of mask use over the last seven days.
• Mobility increases as vaccine coverage increases.
• Omicron variant spreads according to our flight and local spread model.
• 80% of those who have had two doses of vaccine (or one dose for Johnson & Johnson) receive a third dose at six months after their second dose.

The 80% mask use scenario makes all the same assumptions as the reference scenario but assumes all locations reach 80% mask use within seven days. If a location currently has higher than 80% use, mask use remains at the current level.

The third dose scenario is the same as the reference scenario but assumes that 100% of those who have received two doses of vaccine will get a third dose at six months.

Projections

Infections

• Daily estimated infections in the reference scenario will decline to 20 by August 4, 2022 (Figure 23.1).
• Daily estimated infections in the 80% mask use scenario will decline to zero by August 23, 2022 (Figure 23.1).
• Daily estimated infections in the third dose scenario will decline to 20 by August 5, 2022 (Figure 23.1).

Cases

• Daily estimated cases in the reference scenario will decline to 30 by August 18, 2022 (Figure 23.2).
• Daily estimated cases in the 80% mask use scenario will decline to zero by September 1, 2022 (Figure 23.2).
• Daily estimated cases in the third dose scenario will decline to 30 by August 18, 2022 (Figure 23.2).

Hospitalizations

• Daily hospital census in the reference scenario will decline to zero by August 21, 2022 (Figure 23.3).
• Daily hospital census in the 80% mask use scenario will decline to zero by September 1, 2022 (Figure 23.3).
• Daily hospital census in the third dose scenario will decline to zero by August 21, 2022 (Figure 23.3).

Deaths

• In our reference scenario, our model projects 150 cumulative reported deaths due to COVID-19 on September 1. This represents eight additional deaths from May 2 to September 1. Daily reported COVID-19 deaths in the reference scenario will rise to zero by May 5, 2022 (Figure 23.4).
• Under our reference scenario, our model projects 150 cumulative total deaths due to COVID-19 on September 1. This represents eight additional deaths from May 2 to September 1 (Figure 23.5).
• In our 80% mask use scenario, our model projects 150 cumulative reported deaths due to COVID-19 on September 1. This represents eight additional deaths from May 2 to September 1. Daily reported COVID-19 deaths in the 80% mask use scenario will rise to zero by May 5, 2022 (Figure 23.4).

• In our third dose scenario, our model projects 150 cumulative reported deaths due to COVID-19 on September 1. This represents eight additional deaths from May 2 to September 1. Daily reported COVID-19 deaths in the third dose scenario will rise to zero by May 5, 2022 (Figure 23.4).

• Figure 24.1 compares our reference scenario forecasts to other publicly archived models. Forecasts are widely divergent.

• At some point from May through September 1, no countries will have high or extreme stress on hospital beds (Figure 25.1). At some point from May through September 1, nine countries will have high or extreme stress on intensive care unit (ICU) capacity (Figure 26.1).
Model updates

**Figure 5.2:** Total cumulative COVID-19 deaths per 100,000
Figure 6.1: Estimated percent of the population infected with COVID-19 on May 2, 2022

Figure 7.1: Mean effective R on April 21, 2022. Effective R less than 1 means that transmission should decline, all other things being held the same. The estimate of effective R is based on the combined analysis of deaths, case reporting, and hospitalizations where available. Current reported cases reflect infections 11-13 days prior, so estimates of effective R can only be made for the recent past.
Figure 8.1: Percent of estimated COVID-19 infections detected. This is estimated as the ratio of reported daily COVID-19 cases to estimated daily COVID-19 infections based on the SEIR disease transmission model. Due to measurement errors in cases and testing rates, the infection-detection rate can exceed 100% at particular points in time.

- Reference
- Third dose
- 80% mask use
Figure 23.5: Total daily COVID-19 deaths per 100,000
Figure 24.1: Comparison of reference model projections with other COVID modeling groups. For this comparison, we are including projections of daily COVID-19 deaths from other modeling groups when available, last model update in brackets: Delphi from the Massachusetts Institute of Technology (Delphi) [May 2, 2022], and the SI-KJalpha model from the University of Southern California (SIKJalpha) [May 2, 2022]. Regional values are aggregates from available locations in that region.
Figure 25.1: The estimated inpatient hospital usage is shown over time. The percent of hospital beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of beds occupied by COVID-19 patients. Less than 5% is considered low stress, 5-9% is considered moderate stress, 10-19% is considered high stress, and 20% or greater is considered extreme stress.
Figure 26.1: The estimated intensive care unit (ICU) usage is shown over time. The percent of ICU beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of ICU beds occupied by COVID-19 patients. Less than 10% is considered low stress, 10-29% is considered moderate stress, 30-59% is considered high stress, and 60% or greater is considered extreme stress.
More information

Data sources:
Mask use and vaccine confidence data are from the The Delphi Group at Carnegie Mellon University and University of Maryland COVID-19 Trends and Impact Surveys, in partnership with Facebook. Mask use data are also from Premise, the Kaiser Family Foundation, and the YouGov COVID-19 Behaviour Tracker survey.

Genetic sequence and metadata are primarily from the GISAID Initiative. Further details available on the COVID-19 model FAQ page.

A note of thanks:
We wish to warmly acknowledge the support of these and others who have made our COVID-19 estimation efforts possible.
