COVID-19 Results Briefing

Malta

February 18, 2022

This document contains summary information on the latest projections from the IHME model on COVID-19 in Malta. The model was run on February 17, 2022, with data through February 14, 2022.

Current situation

- Daily infections in the last week decreased to 330 per day on average compared to 450 the week before (Figure 1.1). Daily hospital census in the last week (through February 14) decreased to 30 per day on average compared to 41 the week before.
- Daily reported cases in the last week decreased to 140 per day on average compared to 190 the week before (Figure 2.1).
- Reported deaths due to COVID-19 in the last week decreased to 2 per day on average compared to 3 the week before (Figure 3.1).
- Total deaths due to COVID-19 in the last week decreased to 2 per day on average compared to 4 the week before (Figure 3.1). This makes COVID-19 the number 2 cause of death in Malta this week (Table 1). Estimated total daily deaths due to COVID-19 in the past week were 1.4 times larger than the reported number of deaths.
- The daily rate of reported deaths due to COVID-19 is greater than 4 per million in 25 countries (Figure 4.1).
- The daily rate of total deaths due to COVID-19 is greater than 4 per million in 37 countries (Figure 4.2).
- We estimate that 44% of people in Malta have been infected at least once as of February 14 (Figure 6.1). Effective R, computed using cases, hospitalizations, and deaths, is greater than 1 in eight countries. Effective R in Malta was 0.7 on February 3 (Figure 7.1).
- The infection-detection rate in Malta was close to 22% on February 14 (Figure 8.1).
- Based on the GISAID and various national databases, combined with our variant spread model, we estimate the current prevalence of variants of concern (Figures 9.1-9.5). We estimate that the Alpha variant is circulating in 48 countries, that the Beta variant is circulating in 26 countries, that the Delta variant is circulating in 48 countries, that the Gamma variant is circulating in 24 countries, and that the Omicron variant is circulating in 48 countries.

Trends in drivers of transmission

- Mobility last week was 2% lower than the pre-COVID-19 baseline (Figure 11.1). Mobility was lower than 30% of baseline in no locations
- As of February 14, in the COVID-19 Trends and Impact Survey, 38% of people self-report that they always wore a mask when leaving their home compared to 39% last week (Figure 13.1).
- There were 757 diagnostic tests per 100,000 people on February 14 (Figure 15.1).
- As of February 14, 24 countries have reached 70% or more of the population who have received at least one vaccine dose, and 17 countries have reached 70% or more of the population who are fully vaccinated (Figure 17.1). 94% of people in Malta have received at least one vaccine dose, and 88% are fully vaccinated.
- In Malta, 99.2% of the population that is 12 years and older say they would accept, or would probably accept, a vaccine for COVID-19. Note that vaccine acceptance is calculated using survey data from the 18+ population. This is down by 0 percentage points from last week. The proportion of the population who are open to receiving a COVID-19 vaccine ranges from 42% in Republic of Moldova to 99% in Iceland (Figure 19.1).
- In our current reference scenario, we expect that 413,300 people will be vaccinated with at least one dose by June 1 (Figure 20.1). We expect that 88% of the population will be fully vaccinated by June 1.
Projections and scenarios

We produce three scenarios when projecting COVID-19. The **reference scenario** is our forecast of what we think is most likely to happen:

- Vaccines are distributed at the expected pace. Brand- and variant-specific vaccine efficacy is updated using the latest available information from peer-reviewed publications and other reports.
- Future mask use is the mean of mask use over the last seven days.
- Mobility increases as vaccine coverage increases.
- Omicron variant spreads according to our flight and local spread model.
- 80% of those who have had two doses of vaccine (or one dose for Johnson & Johnson) receive a third dose at six months after their second dose.

The **80% mask use scenario** makes all the same assumptions as the reference scenario but assumes all locations reach 80% mask use within seven days. If a location currently has higher than 80% use, mask use remains at the current level.

The **third dose scenario** is the same as the reference scenario but assumes that 100% of those who have received two doses of vaccine will get a third dose at six months.

### Projections

#### Infections

- Daily estimated infections in the **reference scenario** will decline to 50 by June 1, 2022 (Figure 22.1).
- Daily estimated infections in the **80% mask use scenario** will decline to 10 by June 1, 2022 (Figure 22.1).
- Daily estimated infections in the **third dose scenario** will decline to 50 by June 1, 2022 (Figure 22.1).

#### Cases

- Daily estimated cases in the **reference scenario** will decline to 10 by June 1, 2022 (Figure 22.2).
- Daily estimated cases in the **80% mask use scenario** will decline to no by June 1, 2022 (Figure 22.2).
- Daily estimated cases in the **third dose scenario** will decline to 10 by June 1, 2022 (Figure 22.2).

#### Hospitalizations

- Daily hospital census in the **reference scenario** will decline to no by June 1, 2022 (Figure 22.3).
- Daily hospital census in the **80% mask use scenario** will decline to no by June 1, 2022 (Figure 22.3).
- Daily hospital census in the **third dose scenario** will decline to no by June 1, 2022 (Figure 22.3).

#### Deaths

- In our **reference scenario**, our model projects 610 cumulative reported deaths due to COVID-19 on June 1. This represents 15 additional deaths from February 14 to June 1. Daily reported COVID-19 deaths in the **reference scenario** will decline to no by June 1, 2022 (Figure 22.4).
- Under our **reference scenario**, our model projects 840 cumulative total deaths due to COVID-19 on June 1. This represents 20 additional deaths from February 14 to June 1 (Figure 25.2).
- In our **80% mask use scenario**, our model projects 600 cumulative reported deaths due to COVID-19 on June 1. This represents 11 additional deaths from February 14 to June 1. Daily reported COVID-19 deaths in the **80% mask use scenario** will decline to no by June 1, 2022 (Figure 22.4).
- In our **third dose scenario**, our model projects 610 cumulative reported deaths due to COVID-19 on June 1. This represents 15 additional deaths from February 14 to June 1. Daily reported COVID-19 deaths in the **third dose scenario** will decline to no by June 1, 2022 (Figure 22.4).
- Figure 23.1 compares our reference scenario forecasts to other publicly archived models. Forecasts are widely divergent.

Projections and scenarios

We produce three scenarios when projecting COVID-19. The **reference scenario** is our forecast of what we think is most likely to happen:

- Vaccines are distributed at the expected pace. Brand- and variant-specific vaccine efficacy is updated using the latest available information from peer-reviewed publications and other reports.
- Future mask use is the mean of mask use over the last seven days.
- Mobility increases as vaccine coverage increases.
- Omicron variant spreads according to our flight and local spread model.
- 80% of those who have had two doses of vaccine (or one dose for Johnson & Johnson) receive a third dose at six months after their second dose.

The **80% mask use scenario** makes all the same assumptions as the reference scenario but assumes all locations reach 80% mask use within seven days. If a location currently has higher than 80% use, mask use remains at the current level.

The **third dose scenario** is the same as the reference scenario but assumes that 100% of those who have received two doses of vaccine will get a third dose at six months.

### Projections

#### Infections

- Daily estimated infections in the **reference scenario** will decline to 50 by June 1, 2022 (Figure 22.1).
- Daily estimated infections in the **80% mask use scenario** will decline to 10 by June 1, 2022 (Figure 22.1).
- Daily estimated infections in the **third dose scenario** will decline to 50 by June 1, 2022 (Figure 22.1).

#### Cases

- Daily estimated cases in the **reference scenario** will decline to 10 by June 1, 2022 (Figure 22.2).
- Daily estimated cases in the **80% mask use scenario** will decline to no by June 1, 2022 (Figure 22.2).
- Daily estimated cases in the **third dose scenario** will decline to 10 by June 1, 2022 (Figure 22.2).

#### Hospitalizations

- Daily hospital census in the **reference scenario** will decline to no by June 1, 2022 (Figure 22.3).
- Daily hospital census in the **80% mask use scenario** will decline to no by June 1, 2022 (Figure 22.3).
- Daily hospital census in the **third dose scenario** will decline to no by June 1, 2022 (Figure 22.3).

#### Deaths

- In our **reference scenario**, our model projects 610 cumulative reported deaths due to COVID-19 on June 1. This represents 15 additional deaths from February 14 to June 1. Daily reported COVID-19 deaths in the **reference scenario** will decline to no by June 1, 2022 (Figure 22.4).
- Under our **reference scenario**, our model projects 840 cumulative total deaths due to COVID-19 on June 1. This represents 20 additional deaths from February 14 to June 1 (Figure 25.2).
- In our **80% mask use scenario**, our model projects 600 cumulative reported deaths due to COVID-19 on June 1. This represents 11 additional deaths from February 14 to June 1. Daily reported COVID-19 deaths in the **80% mask use scenario** will decline to no by June 1, 2022 (Figure 22.4).
- In our **third dose scenario**, our model projects 610 cumulative reported deaths due to COVID-19 on June 1. This represents 15 additional deaths from February 14 to June 1. Daily reported COVID-19 deaths in the **third dose scenario** will decline to no by June 1, 2022 (Figure 22.4).
- Figure 23.1 compares our reference scenario forecasts to other publicly archived models. Forecasts are widely divergent.

Figure 7.1: Mean effective R on February 3, 2022. Effective R less than 1 means that transmission should decline, all other things being held the same. The estimate of effective R is based on the combined analysis of deaths, case reporting, and hospitalizations where available. Current reported cases reflect infections 11-13 days prior, so estimates of effective R can only be made for the recent past.
Figure 8.1: Percent of estimated COVID-19 infections detected. This is estimated as the ratio of reported daily COVID-19 cases to estimated daily COVID-19 infections based on the SEIR disease transmission model. Due to measurement errors in cases and testing rates, the infection-detection rate can exceed 100% at particular points in time.

Figure 22.5: Total daily COVID-19 deaths per 100,000
Figure 23.1: Comparison of reference model projections with other COVID modeling groups.
For this comparison, we are including projections of daily COVID-19 deaths from other modeling groups when available, last model update in brackets: Delphi from the Massachusetts Institute of Technology (Delphi) [February 17, 2022], Imperial College London (Imperial) [January 2, 2022], the SI-KJalpha model from the University of Southern California (SIKJalpha) [February 17, 2022]. Daily deaths from other modeling groups are smoothed to remove inconsistencies with rounding. Regional values are aggregates from available locations in that region.
Figure 24.1: The estimated inpatient hospital usage is shown over time. The percent of hospital beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of beds occupied by COVID-19 patients. Less than 5% is considered low stress, 5-9% is considered moderate stress, 10-19% is considered high stress, and 20% or greater is considered extreme stress.
Figure 25.1: The estimated intensive care unit (ICU) usage is shown over time. The percent of ICU beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of ICU beds occupied by COVID-19 patients. Less than 10% is considered low stress, 10-29% is considered moderate stress, 30-59% is considered high stress, and 60% or greater is considered extreme stress.
More information

Data sources:
Mask use and vaccine confidence data are from the The Delphi Group at Carnegie Mellon University and University of Maryland COVID-19 Trends and Impact Surveys, in partnership with Facebook. Mask use data are also from Premise, the Kaiser Family Foundation, and the YouGov COVID-19 Behaviour Tracker survey.

Genetic sequence and metadata are primarily from the GISAID Initiative. Further details available on the COVID-19 model FAQ page.

A note of thanks:
We wish to warmly acknowledge the support of these and others who have made our COVID-19 estimation efforts possible.
