COVID-19 Results Briefing

The Western Pacific Region

December 22, 2021

This document contains summary information on the latest projections from the IHME model on COVID-19 in the Western Pacific Region. The model was run on December 21, 2021, with data through December 13, 2021.

In this release, we have substantially revised our model to reflect the emergence of the Omicron variant, waning infection-acquired and vaccine-acquired immunity, and the matrix of immunity across variants.

Our reference scenario suggests that daily estimated infections will rise to 1,856,100 by February 10, 2022 in the Western Pacific Region. Although we project a much greater fraction of asymptomatic infections (likely over 90%) and thus a lower infection-detection rate, we estimate that diagnosed cases will increase to a peak of 134,900 per day by early February.

Based on the data from South Africa, the United Kingdom, Denmark, and Norway, we expect that the infection-hospitalization rate (IHR) for Omicron compared to Delta will be 90%–96% lower. Despite the lower IHR, the pressure on hospitals is likely to be considerable in some countries. The global peak of hospital admissions will likely be lower than for Delta and similar to the peak in January 2021. Likewise, based on the available data, we expect the infection-fatality rate (IFR) will be 97%–99% lower than for Delta. Huge numbers of infections and moderate numbers of hospitalizations may still translate into 169,000 cumulative reported deaths due to COVID-19 in the Western Pacific Region on April 1, representing 23,000 additional deaths from December 13 to April 1.

Our forecasts are more optimistic than some forecasts such as those from the SAGE group in the United Kingdom, who have put out numbers suggesting massively higher daily deaths than at any prior point in time. While we believe our reference forecast reflects the available evidence on Omicron, huge uncertainties remain for key assumptions: Omicron immune escape, increased transmissibility, substantial reduced vaccine-specific efficacy for preventing infection, moderate reductions in vaccine-specific efficacy in preventing hospitalization and death, the speed of waning vaccine-derived immunity for infection and hospitalization/death, the speed of waning of infection- acquired immunity, and severity of Omicron infection. The most important uncertainty is how severe Omicron infection is. Our assumptions on reduced severity may turn out to be pessimistic; for example, hospital admissions in the UK are rising extremely slowly.

In our more severe Omicron scenario for the Western Pacific Region, hospital admissions could reach levels above 21,480 and reported daily deaths could exceed 580 by March 24, 2022. Decision-makers need to choose courses of action in the face of very considerable uncertainty. We expect holiday period lags in reporting cases, hospitalizations and deaths will heighten uncertainty until early January. Sufficient data to revise our assessment of severity may not emerge until the second or third week of January.
What policy responses are available? We have included in this release scenarios of increasing mask use to 80%, increasing third-dose vaccine delivery from 80% in the reference scenario to 100% of those who received two doses, and making progress against vaccine hesitancy. Given the speed of the global spread of Omicron and the very short doubling time for Omicron transmission, increasing mask use to 80% has the most immediate and largest impact. Our third dose scenario has a small effect because of two assumptions: third doses are only delivered six months after the second dose, and the reference scenario already has 80% receiving the third dose. In future releases, we will test the impact of shorter intervals for the third dose such as three to four months. Those countries, that have low vaccination rates due to lack of access to supply are not affected by the third dose scenario. While not explicitly modeled, given the transmissibility of Omicron, promoting the use of higher-quality masks such as KN95 or N95 would be consistent with the available data. Our mask scenario suggests that increasing the mask coverage to 80% could save around 2,000 lives by April 1. Given the rapid spread and much reduced IHR and IFR, we do not believe elementary or secondary school closures are appropriate. More aggressive lockdowns to control transmission may reduce the pressure on some hospital systems but will come at considerable economic and social costs. Given that screening programs are likely to yield many asymptomatic cases, workplace screening and protocols on how long individuals need to stay away from work may need to be modified – otherwise, there may be a considerable impact on some employers and on some supply chains. Extremely high rates of transmission and reported cases may also mean that contact tracing may be ineffective and potentially a waste of resources. With high infection rates and the projected stress on some hospitals, hospitalization rates should be used as a metric to drive policy at the local level. The medical system is already exhausted, and some medical staff may get infected and have to isolate, so the workforce may be impacted even more. There are huge variations in the capacity of hospitals to expand to meet the surge, and local metrics are needed.

Individuals can act to protect themselves by getting vaccinated if not already vaccinated and getting a third dose as soon as they are eligible. Individuals at any elevated risk due to age or comorbidities who wish to reduce their risk of hospitalization or death should wear a mask, preferably a high-quality mask such as an N95 mask, and avoid situations where transmission is more likely, such as any indoor gathering or outdoor gathering where distancing is not possible. Individuals who are not vaccinated or have never been infected should also be particularly concerned.

Current situation

- Daily infections in the last week increased to 288,800 per day on average compared to 227,600 the week before (Figure 1.1). Daily hospital census in the last week (through December 13) remained constant at 7,900 per day on average, the same as the week before.

- Daily reported cases in the last week increased to 33,800 per day on average compared to 33,100 the week before (Figure 2.1).

- Reported deaths due to COVID-19 in the last week increased to 370 per day on average compared to 330 the week before (Figure 3.1).
• Total deaths due to COVID-19 in the last week increased to 940 per day on average compared to 880 the week before (Figure 3.1). This makes COVID-19 the number 10 cause of death in the Western Pacific Region this week (Table 1). Estimated total daily deaths due to COVID-19 in the past week were 2.5 times larger than the reported number of deaths.

• No locations had daily reported COVID-19 death rates greater than 4 per million (Figure 4.1).

• The daily rate of reported deaths due to COVID-19 is greater than 4 per million in two countries (Vietnam and Lao People’s Democratic Republic) and no subnational locations. (Figure 4.2).

• We estimate that 5% of people in the Western Pacific Region have been infected at least once as of December 13 (Figure 6.1). Effective R, computed using cases, hospitalizations, and deaths, is greater than 1 in seven countries and three subnational locations in the region. (Figure 7.1).

• The infection-detection rate in the Western Pacific Region was close to 17% on December 13 (Figure 8.1).

• Based on the GISAID and various national databases, combined with our variant spread model, we estimate the current prevalence of variants of concern (Figure 9.1-Figure 9.5). We estimate that the Alpha variant is circulating in two countries and 0 subnational locations, that the Beta variant is circulating in 0 countries and 0 subnational locations, that the Delta variant is circulating in 18 countries and three subnational locations, that the Gamma variant is circulating in 0 countries and 0 subnational locations and that the Omicron variant is circulating in 12 countries and 33 subnational locations.

Trends in drivers of transmission

• Mobility last week was 9% lower than the pre-COVID-19 baseline (Figure 11.1). Mobility was lower than 30% of baseline in two countries in the region.

• As of December 13, in the COVID-19 Trends and Impact Survey, 65% of people self-report that they always wore a mask when leaving their home, the same as last week (Figure 13.1).

• There were 126 diagnostic tests per 100,000 people on December 13 (Figure 15.1).

• As of December 13, 16 countries and 31 subnational locations have reached 70% or more of the population who have received at least one vaccine dose and nine countries and 31 subnational locations have reached 70% or more of the population who are fully vaccinated (Figure 17.1). 84% of people in the Western Pacific Region have received at least one vaccine dose and 75% are fully vaccinated.
• In the Western Pacific Region, 95.7% of the population that is 12 years and older say they would accept or would probably accept a vaccine for COVID-19. Note that vaccine acceptance is calculated using survey data from the 18+ population. This is up by 0.2 percentage points from last week. The proportion of the population who are open to receiving a COVID-19 vaccine ranges from 61% in Mongolia to 100% in Malaysia, Brunei Darussalam (Figure 19.1).

• In our current reference scenario, we expect that 1.6 billion people will be vaccinated with at least one dose by April 1 (Figure 20.1). We expect that 80% of the population will be fully vaccinated by April 1.

Projections

Infections

• Daily estimated infections in the reference scenario, which represents what we think is most likely to happen, will rise to 1,856,100 by February 10, 2022 (Figure 21.1).

• Daily estimated infections in the high severity of Omicron scenario will rise to 1,830,760 by February 7, 2022 (Figure 21.1).

• Daily estimated infections in the 80% mask coverage scenario will rise to 1,695,120 by January 30, 2022 (Figure 21.1).

• Daily estimated infections in the third dose scenario will rise to 1,678,390 by January 30, 2022 (Figure 21.1).

• Daily estimated infections in the reduced vaccine hesitancy scenario will rise to 1,848,910 by February 10, 2022 (Figure 21.1).

Cases

• Daily cases in the reference scenario will rise to 134,900 by January 29, 2022 (Figure 21.2).

• Daily cases in the high severity of Omicron scenario will rise to 135,130 by January 29, 2022 (Figure 21.2).

• Daily cases in the 80% mask coverage scenario will rise to 130,610 by January 27, 2022 (Figure 21.2).

• Daily cases in the third dose scenario will rise to 130,660 by January 28, 2022 (Figure 21.2).

• Daily cases in the reduced vaccine hesitancy scenario will rise to 134,680 by January 29, 2022 (Figure 21.2).

Hospitalizations

• Daily hospital census in the reference scenario will rise to 12,510 by February 23, 2022 (Figure 21.3).
• Daily hospital census in the **high severity of Omicron scenario** will rise to 21,480 by March 14, 2022 (Figure 21.3).

• Daily hospital census in the **80% mask coverage scenario** will rise to 11,640 by February 20, 2022 (Figure 21.3).

• Daily hospital census in the **third dose scenario** will rise to 11,180 by February 18, 2022 (Figure 21.3).

• Daily hospital census in the **reduced vaccine hesitancy scenario** will rise to 12,380 by February 22, 2022 (Figure 21.3).

Deaths

• In our **reference scenario**, our model projects 169,000 cumulative reported deaths due to COVID-19 on April 1. This represents 23,000 additional deaths from December 13 to April 1. Daily reported COVID-19 deaths in the **reference scenario** will decline to 170 by January 19, 2022 (Figure 21.4).

• Under our **reference scenario**, our model projects 366,000 cumulative total deaths due to COVID-19 on April 1. This represents 44,000 additional deaths from December 13 to April 1 (Figure 24.2).

• In our **high severity of Omicron scenario**, our model projects 186,000 cumulative reported deaths due to COVID-19 on April 1. This represents 40,000 additional deaths from December 13 to April 1. Daily reported COVID-19 deaths in the **high severity of Omicron scenario** will rise to 580 by March 24, 2022 (Figure 21.4).

• In our **80% mask coverage scenario**, our model projects 167,000 cumulative reported deaths due to COVID-19 on April 1. This represents 21,000 additional deaths from December 13 to April 1. Daily reported COVID-19 deaths in the **80% mask coverage scenario** will decline to 160 on April 1, 2022 (Figure 21.4).

• In our **third dose scenario**, our model projects 165,000 cumulative reported deaths due to COVID-19 on April 1. This represents 20,000 additional deaths from December 13 to April 1. Daily reported COVID-19 deaths in the **third dose scenario** will decline to 100 on April 1, 2022 (Figure 21.4).

• In our **reduced vaccine hesitancy scenario**, our model projects 169,000 cumulative reported deaths due to COVID-19 on April 1. This represents 23,000 additional deaths from December 13 to April 1. Daily reported COVID-19 deaths in the **reduced vaccine hesitancy scenario** will decline to 170 by January 21, 2022 (Figure 21.4).

• Figure 22.1 compares our reference scenario forecasts to other publicly archived models. Forecasts are widely divergent.
Model updates

In this update, we have substantially revised our model to explicitly account for several important factors that have a profound influence on the likely trajectory of the epidemic in the coming months. First, the model tracks infections from different variants separately, including ancestral, Alpha, Beta, Gamma, Delta, Omicron, and other. Second, we take into account that infection-derived and vaccine-derived immunity wanes over time. Immunity that prevents infection wanes more quickly than immunity preventing hospitalization and death, so we derive separate waning curves for infection and for hospitalization and death. Based on a systematic analysis of published studies, reports, and archived studies, we derive vaccine-specific waning curves. Third, infection with different COVID-19 variants can confer different protection for each variant in the model. The matrix of cross-variant immunity allows us to take into account the greater immune escape seen with Omicron. Third, we explicitly model the delivery of a third dose of vaccine (and second dose for J&J recipients). Fourth, the variant spread model is now based on both spatial spread and patterns of airline traffic. The technical appendix provides details of the model structure and the analysis of waning immunity.

The critical driver of our forecasts in the next months is the spread of the Omicron variant. Critical assumptions about the Omicron variant are based on our analysis of all the available lab data on vaccine efficacy, test-negative vaccine effectiveness studies in South Africa and the UK, population-level data on PCR positivity in representative samples of the population, and detected cases, hospitalization, and deaths in South Africa, the UK, Denmark, and Norway. More details on this analysis are in the technical appendix. The key assumptions that substantially influence the forecasts include the following: First, prior infection provides 40% to 60% protection against infection with Omicron. Second, vaccine effectiveness in preventing infection is reduced by approximately 50% compared to the efficacy against the Delta variant, and vaccine effectiveness in preventing hospitalization and death is reduced by 25% compared to the efficacy against the Delta variant. Third, the fraction asymptomatic is assumed to increase from near 40% to 90%-95%; this fraction influences the future estimates of the infection-detection rate. Fourth, the infection-hospitalization rate for Omicron is estimated to be 90%-96% lower than for Delta variant. Fifth, the infection-fatality rate for Omicron is estimated to be 97%-99% lower than for Delta.

Figure 20.1. Percent of people who receive at least one dose of a COVID-19 vaccine and those who are fully vaccinated
Western Pacific Region

Projections and scenarios

We produce five scenarios when projecting COVID-19. The reference scenario is our forecast of what we think is most likely to happen:

- Vaccines are distributed at the expected pace. Brand- and variant-specific vaccine efficacy is updated using the latest available information from peer-reviewed publications and other reports.
- Future mask use is the mean of mask use over the last 7 days.
- Mobility increases as vaccine coverage increases.
- Omicron variant spreads according to our flight and local spread model.

- 80% of those who have had two doses of vaccine (or one dose for Johnson & Johnson) receive a third dose at 6 months after their second dose.

The high severity of Omicron scenario modifies the reference scenario assumption in two ways:
* The infection-hospitalization ratio for Omicron is 2.3 times as high as compared to the reference scenario.
* The infection-fatality rate is 4.6 times as high as compared to the reference scenario.

The 80% mask use scenario makes all the same assumptions as the reference scenario but assumes all locations reach 80% mask use within 7 days. If a location currently has higher than 80% use, mask use remains at the current level.

The third dose scenario is the same as the reference scenario but assumes that 100% of those who have received two doses of vaccine will get a third dose at 6 months.

The reduced vaccine hesitancy scenario assumes that those in each location who respond on surveys that they probably will not receive a vaccine are persuaded or mandated to receive a vaccine.

**Western Pacific Region**

**Figure 21.3.** Daily COVID-19 hospital census until April 01, 2022 for five scenarios

- **Hospital census per 100,000 population**
- **Scenario Variations**:
  - 80% mask use
  - Reduced vaccine hesitancy
  - High severity of Omicron
  - Reference scenario
  - Third dose

**Figure 21.4** Reported daily COVID-19 deaths per 100,000

- **Daily deaths per 100,000**
- **Scenario Variations**:
  - Reference scenario
  - High severity of Omicron
  - 80% mask use
  - Reduced vaccine hesitancy
  - Third dose
Figure 21.5 Total daily COVID-19 deaths per 100,000

- Reference scenario
- High severity of Omicron
- Third dose
- 80% mask use
- Reduced vaccine hesitancy
Figure 22.1. Comparison of reference model projections with other COVID modeling groups. For this comparison, we are including projections of daily COVID-19 deaths from other modeling groups when available, last model update in brackets: Delphi from the Massachusetts Institute of Technology (Delphi) [December 21, 2021], Imperial College London (Imperial) [December 5, 2021], the SI-KJalpha model from the University of Southern California (SIKJalpha) [December 19, 2021]. Daily deaths from other modeling groups are smoothed to remove inconsistencies with rounding. Regional values are aggregates from available locations in that region.
More information

Data sources:
Mask use and vaccine confidence data are from the The Delphi Group at Carnegie Mellon University and University of Maryland COVID-19 Trends and Impact Surveys, in partnership with Facebook. Mask use data are also from Premise, the Kaiser Family Foundation, and the YouGov COVID-19 Behaviour Tracker survey.

Genetic sequence and metadata are primarily from the GISAID Initiative. Further details available on the COVID-19 model FAQ page.

A note of thanks:
We wish to warmly acknowledge the support of these and others who have made our COVID-19 estimation efforts possible.
