COVID-19 Results Briefing

Indonesia

May 5, 2022

This document contains summary information on the latest projections from the IHME model on COVID-19 in Indonesia. The model was run on May 5, 2022, with data through May 2, 2022.

Estimated infections, reported cases, and reported hospital admissions have been decreasing in Indonesia. Mobility has increased and mask wearing is declining. We do not forecast a rise in cases in the coming months in the country. However, with all the increased activities and travel for Eid El-Fitr, it is possible that the decline will slow down.

At the global level, COVID deaths are at the lowest level since April 2020. The global trend is dominated by events in East Asia. Taiwan is undergoing a huge Omicron surge. China continues to pursue a zero-COVID strategy through multiple strict lockdowns, with marked reductions in mobility throughout most of the country. Secondary Omicron waves in many parts of Europe and Canada have largely peaked or are peaking. Some US states are entering a period of rising transmission, most likely linked to behavioral relaxation. Cases, hospitalizations, and deaths are increasing in the US as well. The increase in reported cases in South Africa in a population with high levels of prior Omicron infection, which coincides with a shift to the BA.4 and BA.5 subvariants, has raised questions about cross-variant immunity between BA.1 or BA.2 and BA.4 or BA.5. It is too early to tell if the increase is driven by lower cross-variant immunity within Omicron subvariants or waning of infection-acquired immunity. In our models, we do not yet model BA.4 and BA.5 as separate variants with differential cross-variant immunity. So, our forecasts of a peak at the global level in May and then declines over the summer could be revised if evidence on BA.4 and BA.5 becomes clearer.

Based on vaccination rates and reported willingness to get vaccinated, we estimate that 3.1% of the world population are willing to be vaccinated but have not yet been vaccinated. This 3.1% is heavily concentrated in sub-Saharan Africa. Among the 3.1% who want to be vaccinated, it is likely that three-quarters have some immunity through prior infection. Given the potential for a new variant that is more transmissible and more severe than Omicron to emerge at any time, given that vaccination rates are unlikely to increase much, and given the strong likelihood of further behavioral relaxation across the region, controlling COVID-19 over the next months should focus on three factors. First, continued surveillance, even as interest in the pandemic fades in some policy circles. Identifying new variants and whether they have increased severity or not will be critical to titrating the policy response. Second, the world needs greater focus on expanding production and access to Paxlovid and other antivirals as they become available. The randomized clinical trial suggests that Paxlovid can dramatically reduce the infection-fatality rate; increased access globally can greatly reduce the future risk of harm of new variants. Third, the use of other strategies such as encouraging mask use may be needed if evidence on reduced cross-variant immunity for BA.4 and BA.5 becomes clearer and these subvariants have a higher infection-fatality rate than BA.1 and BA.2.
Current situation

• Daily infections in the last week decreased to 78,000 per day on average compared to 90,000 the week before (Figure 1.1). Daily hospital census in the last week (through May 2) decreased to 1,100 per day on average compared to 1,400 the week before.

• Daily reported cases in the last week decreased to 420 per day on average compared to 600 the week before (Figure 2.1).

• Reported deaths due to COVID-19 in the last week decreased to 24 per day on average compared to 32 the week before (Figure 3.1).

• Total deaths due to COVID-19 in the last week decreased to 100 per day on average compared to 140 the week before (Figure 3.1). This makes COVID-19 the number 13 cause of death in Indonesia this week (Table 1). Estimated total daily deaths due to COVID-19 in the past week were 4.4 times larger than the reported number of deaths.

• The daily rate of reported deaths due to COVID-19 is greater than 4 per million in no locations (Figure 4.1).

• The daily rate of total deaths due to COVID-19 is greater than 4 per million in one location (Figure 4.2).

• We estimate that 84% of people in Indonesia have been infected at least once as of May 2 (Figure 6.1). Effective R, computed using cases, hospitalizations, and deaths, is greater than 1 in four locations and 22 subnational locations. Effective R in Indonesia was 0.8 on April 21 (Figure 7.1).

• The infection-detection rate in Indonesia was close to 1% on May 2 (Figure 8.1).

• Based on the GISAID and various national databases, combined with our variant spread model, we estimate the current prevalence of variants of concern (Figures 9.1–9.5). We estimate that the Alpha variant is circulating in eight locations and 26 subnational locations, that the Beta variant is circulating in three locations and seven subnational locations, that the Delta variant is circulating in 11 locations and 35 subnational locations, that the Gamma variant is circulating in four locations and five subnational locations, and that the Omicron variant is circulating in 11 locations and 35 subnational locations.

Trends in drivers of transmission

• Mobility last week was 6% higher than the pre-COVID-19 baseline (Figure 11.1). Mobility was lower than 15% of baseline in two locations (Figure 12.1).

• As of April 24, in the COVID-19 Trends and Impact Survey, 62% of people self-reported that they always wore a mask when leaving their home compared to 63% the previous week (Figure 13.1).

• There were 45 diagnostic tests per 100,000 people on May 2 (Figure 15.1).
As of May 2, nine locations and 16 subnational locations have reached 70% or more of the population who have received at least one vaccine dose, and six locations and nine subnational locations have reached 70% or more of the population who are fully vaccinated (Figures 17.1 and 17.2). 77% of people in Indonesia have received at least one vaccine dose, and 65% are fully vaccinated.

In Indonesia, 88.6% of the population that is 12 years and older say they would accept a vaccine for COVID-19 (Figure 18.1). This is up by 0.4 percentage points from last week. Note that vaccine acceptance is calculated using survey data from the 18+ population. The proportion of the population who are open to receiving a COVID-19 vaccine ranges from 45% in Timor-Leste to 99% in Bangladesh (Figure 19.1).

As of April 25, 2022, 4.8% of the population in Indonesia say they would accept a vaccine for COVID-19 but have not yet been vaccinated.

In our current reference scenario, we expect that 206.7 million people will be vaccinated with at least one dose by September 1 (Figure 21.1). We expect that 74% of the population will be fully vaccinated by September 1.

Projections and scenarios

We produce three scenarios when projecting COVID-19. The **reference scenario** is our forecast of what we think is most likely to happen:

- Vaccines are distributed at the expected pace. Brand- and variant-specific vaccine efficacy is updated using the latest available information from peer-reviewed publications and other reports.
- Future mask use is the mean of mask use over the last seven days.
- Mobility increases as vaccine coverage increases.
- Omicron variant spreads according to our flight and local spread model.
- 80% of those who have had two doses of vaccine (or one dose for Johnson & Johnson) receive a third dose at six months after their second dose.

The **80% mask use scenario** makes all the same assumptions as the reference scenario but assumes all locations reach 80% mask use within seven days. If a location currently has higher than 80% use, mask use remains at the current level.

The **third dose scenario** is the same as the reference scenario but assumes that 100% of those who have received two doses of vaccine will get a third dose at six months.

Projections

Infections

- Daily estimated infections in the **reference scenario** will rise to 92,180 by September 1, 2022 (Figure 23.1).
- Daily estimated infections in the **80% mask use scenario** will decline to 32,270 by June 30, 2022 (Figure 23.1).
• Daily estimated infections in the **third dose scenario** will rise to 75,120 by September 1, 2022 (Figure 23.1).

Cases

• Daily estimated cases in the **reference scenario** will rise to 570 by September 1, 2022 (Figure 23.2).

• Daily estimated cases in the **80% mask use scenario** will rise to 430 by May 14, 2022 (Figure 23.2).

• Daily estimated cases in the **third dose scenario** will rise to 470 by September 1, 2022 (Figure 23.2).

Hospitalizations

• Daily hospital census in the **reference scenario** will decline to 470 by June 21, 2022 (Figure 23.3).

• Daily hospital census in the **80% mask use scenario** will decline to 280 by July 15, 2022 (Figure 23.3).

• Daily hospital census in the **third dose scenario** will decline to 460 by June 24, 2022 (Figure 23.3).

Deaths

• In our **reference scenario**, our model projects 157,000 cumulative reported deaths due to COVID-19 on September 1. This represents 680 additional deaths from May 2 to September 1. Daily reported COVID-19 deaths in the **reference scenario** will decline to zero by June 29, 2022 (Figure 23.4).

• Under our **reference scenario**, our model projects 683,000 cumulative total deaths due to COVID-19 on September 1. This represents 3,100 additional deaths from May 2 to September 1 (Figure 23.5).

• In our **80% mask use scenario**, our model projects 157,000 cumulative reported deaths due to COVID-19 on September 1. This represents 510 additional deaths from May 2 to September 1. Daily reported COVID-19 deaths in the **80% mask use scenario** will decline to zero by July 24, 2022 (Figure 23.4).

• In our **third dose scenario**, our model projects 157,000 cumulative reported deaths due to COVID-19 on September 1. This represents 660 additional deaths from May 2 to September 1. Daily reported COVID-19 deaths in the **third dose scenario** will decline to zero by July 2, 2022 (Figure 23.4).

• Figure 24.1 compares our reference scenario forecasts to other publicly archived models. Forecasts are widely divergent.

• At some point from May through September 1, no locations will have high or extreme stress on hospital beds (Figure 25.1). At some point from May through September 1, one location will have high or extreme stress on intensive care unit (ICU) capacity (Figure 26.1).

Figure 4.2: Daily total COVID-19 death rate per 1 million
Cumulative COVID-19 deaths per 100,000 on May 2, 2022

Figure 5.1: Reported cumulative COVID-19 deaths per 100,000

Figure 5.2: Total cumulative COVID-19 deaths per 100,000
Figure 6.1: Estimated percent of the population infected with COVID-19 on May 2, 2022

Figure 7.1: Mean effective R on April 21, 2022. Effective R less than 1 means that transmission should decline, all other things being held the same. The estimate of effective R is based on the combined analysis of deaths, case reporting, and hospitalizations where available. Current reported cases reflect infections 11-13 days prior, so estimates of effective R can only be made for the recent past.
Figure 8.1: Percent of estimated COVID-19 infections detected. This is estimated as the ratio of reported daily COVID-19 cases to estimated daily COVID-19 infections based on the SEIR disease transmission model. Due to measurement errors in cases and testing rates, the infection-detection rate can exceed 100% at particular points in time.

Percent of the population having received at least one dose (17.1) and fully vaccinated against SARS-CoV-2 (17.2) by May 2, 2022

Figure 17.1: Percent of the population having received one dose of a COVID-19 vaccine

Figure 17.2: Percent of the population fully vaccinated against SARS-CoV-2
Figure 18.1: Trend in the estimated proportion of the population that is 12 years and older that has been vaccinated or would definitely receive the COVID-19 vaccine if available. Note that vaccine acceptance is calculated using survey data from the 18+ population.

Figure 19.1: Estimated proportion of the population that is 12 years and older that has been vaccinated or would definitely receive the COVID-19 vaccine if available. Note that vaccine acceptance is calculated using survey data from the 18+ population.
Figure 20.1: Estimated proportion of the total population that is not vaccinated but willing to be vaccinated as of April 25, 2022
Figure 21.1: Percent of people who receive at least one dose of a COVID-19 vaccine and those who are fully vaccinated

Figure 22.1: Percent of people who are immune to Delta or Omicron. Immunity is based on protection due to prior vaccination and infection(s). Moreover, variant-specific immunity is also based on variant-variant specific protection.
Projections and scenarios

Figure 23.1: Daily COVID-19 infections until September 01, 2022 for three scenarios

Figure 23.2: Daily COVID-19 reported cases until September 01, 2022 for three scenarios
Figure 23.3: Daily COVID-19 hospital census until September 01, 2022 for three scenarios
Figure 23.4: Reported daily COVID-19 deaths per 100,000
Figure 23.5: Total daily COVID-19 deaths per 100,000
Figure 24.1: Comparison of reference model projections with other COVID modeling groups. For this comparison, we are including projections of daily COVID-19 deaths from other modeling groups when available, last model update in brackets: Delphi from the Massachusetts Institute of Technology (Delphi) [May 2, 2022], and the SI-KJalpha model from the University of Southern California (SIKJalpha) [May 2, 2022]. Regional values are aggregates from available locations in that region.
Figure 25.1: The estimated inpatient hospital usage is shown over time. The percent of hospital beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of beds occupied by COVID-19 patients. Less than 5% is considered low stress, 5-9% is considered moderate stress, 10-19% is considered high stress, and 20% or greater is considered extreme stress.
Figure 26.1: The estimated intensive care unit (ICU) usage is shown over time. The percent of ICU beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of ICU beds occupied by COVID-19 patients. Less than 10% is considered low stress, 10-29% is considered moderate stress, 30-59% is considered high stress, and 60% or greater is considered extreme stress.
More information

Data sources:

Mask use and vaccine confidence data are from the The Delphi Group at Carnegie Mellon University and University of Maryland COVID-19 Trends and Impact Surveys, in partnership with Facebook. Mask use data are also from Premise, the Kaiser Family Foundation, and the YouGov COVID-19 Behaviour Tracker survey.

Genetic sequence and metadata are primarily from the GISAID Initiative. Further details available on the COVID-19 model FAQ page.

A note of thanks:

We wish to warmly acknowledge the support of these and others who have made our COVID-19 estimation efforts possible.
