COVID-19 Results Briefing
The African Region
May 5, 2022

This document contains summary information on the latest projections from the IHME model on COVID-19 in African Region. The model was run on May 5, 2022, with data through May 3, 2022.

Current situation

- Daily infections in the last week increased to 1,038,000 per day on average compared to 714,000 the week before (Figure 1.1). Daily hospital census in the last week (through May 3) increased to 3,800 per day on average compared to 3,100 the week before.
- Daily reported cases in the last week increased to 5,000 per day on average compared to 3,900 the week before (Figure 2.1).
- Reported deaths due to COVID-19 in the last week decreased to 10 per day on average compared to 24 the week before (Figure 3.1).
- Total deaths due to COVID-19 in the last week decreased to 54 per day on average compared to 140 the week before (Figure 3.1). This makes COVID-19 the number 48 cause of death in African Region this week (Table 1). Estimated total daily deaths due to COVID-19 in the past week were 5.2 times larger than the reported number of deaths.
- The daily rate of reported deaths due to COVID-19 is greater than 4 per million in no countries (Figure 4.1).
- The daily rate of total deaths due to COVID-19 is greater than 4 per million in no countries (Figure 4.2).
- We estimate that 85% of people in African Region have been infected at least once as of May 2 (Figure 6.1). Effective R, computed using cases, hospitalizations, and deaths, is greater than 1 in 16 countries. (Figure 7.1).
- The infection-detection rate in African Region was close to 1% on May 2 (Figure 8.1).
- Based on the GISAID and various national databases, combined with our variant spread model, we estimate the current prevalence of variants of concern (Figures 9.1-9.5). We estimate that the Alpha variant is circulating in 37 countries, that the Beta variant is circulating in 36 countries, that the Delta variant is circulating in 42 countries, that the Gamma variant is circulating in 24 countries, and that the Omicron variant is circulating in 42 countries.

Trends in drivers of transmission

- Mobility last week was 52% higher than the pre-COVID-19 baseline (Figure 11.1). Mobility was lower than 15% of baseline in no countries (Figure 12.1).
- As of April 24, in the COVID-19 Trends and Impact Survey, 32% of people self-reported that they always wore a mask when leaving their home compared to 33% the previous week (Figure 13.1).
- There were 10 diagnostic tests per 100,000 people on May 2 (Figure 15.1).
- As of May 2, two countries have reached 70% or more of the population who have received at least one vaccine dose, and two countries have reached 70% or more of the population who are fully vaccinated (Figures 17.1 and 17.2). 19% of people in African Region have received at least one vaccine dose, and 16% are fully vaccinated.
- In the African Region, 43.7% of the population that is 12 years and older say they would accept a vaccine for COVID-19 (Figure 18.1). This is up by 0.2 percentage points from last week. Note that vaccine acceptance is calculated using survey data from the 18+ population. The proportion of the population who are open to receiving a COVID-19 vaccine ranges from 17% in Madagascar to 99% in Seychelles (Figure 19.1).
- As of April 25, 2022, 10.1 percent of the population in African Region say they would accept a vaccine for COVID-19 but have not yet been vaccinated.
- In our current reference scenario, we expect that 243.5 million people will be vaccinated with at least
one dose by September 1 (Figure 21.1). We expect that 20% of the population will be fully vaccinated by September 1.

Projections and scenarios

We produce three scenarios when projecting COVID-19. The reference scenario is our forecast of what we think is most likely to happen:

- Vaccines are distributed at the expected pace. Brand- and variant-specific vaccine efficacy is updated using the latest available information from peer-reviewed publications and other reports.
- Future mask use is the mean of mask use over the last seven days.
- Mobility increases as vaccine coverage increases.
- Omicron variant spreads according to our flight and local spread model.
- 80% of those who have had two doses of vaccine (or one dose for Johnson & Johnson) receive a third dose at six months after their second dose.

The 80% mask use scenario makes all the same assumptions as the reference scenario but assumes all locations reach 80% mask use within seven days. If a location currently has higher than 80% use, mask use remains at the current level.

The third dose scenario is the same as the reference scenario but assumes that 100% of those who have received two doses of vaccine will get a third dose at six months.

Projections

Infections

- Daily estimated infections in the reference scenario will rise to 1,273,670 by May 9, 2022 (Figure 23.1).
- Daily estimated infections in the 80% mask use scenario will rise to 1,171,970 by May 3, 2022 (Figure 23.1).
- Daily estimated infections in the third dose scenario will rise to 1,273,610 by May 9, 2022 (Figure 23.1).

Cases

- Daily estimated cases in the reference scenario will decline to 2,320 by September 1, 2022 (Figure 23.2).
- Daily estimated cases in the 80% mask use scenario will decline to 1,670 by September 1, 2022 (Figure 23.2).
- Daily estimated cases in the third dose scenario will decline to 2,290 by September 1, 2022 (Figure 23.2).

Hospitalizations

- Daily hospital census in the reference scenario will rise to 8,330 by July 17, 2022 (Figure 23.3).
- Daily hospital census in the 80% mask use scenario will rise to 6,230 by May 19, 2022 (Figure 23.3).
- Daily hospital census in the third dose scenario will rise to 8,260 by July 17, 2022 (Figure 23.3).

Deaths

- In our reference scenario, our model projects 176,000 cumulative reported deaths due to COVID-19 on September 1. This represents 6,800 additional deaths from May 2 to September 1. Daily reported COVID-19 deaths in the reference scenario will rise to 70 by July 9, 2022 (Figure 23.4).
- Under our reference scenario, our model projects 1,861,000 cumulative total deaths due to COVID-19 on September 1. This represents 44,000 additional deaths from May 2 to September 1 (Figure 23.5).
• In our **80% mask use scenario**, our model projects 173,000 cumulative reported deaths due to COVID-19 on September 1. This represents 4,700 additional deaths from May 2 to September 1. Daily reported COVID-19 deaths in the **80% mask use scenario** will rise to 50 by May 30, 2022 (Figure 23.4).

• In our **third dose scenario**, our model projects 175,000 cumulative reported deaths due to COVID-19 on September 1. This represents 6,700 additional deaths from May 2 to September 1. Daily reported COVID-19 deaths in the **third dose scenario** will rise to 70 by July 8, 2022 (Figure 23.4).

• Figure 24.1 compares our reference scenario forecasts to other publicly archived models. Forecasts are widely divergent.

• At some point from May through September 1, one country will have high or extreme stress on hospital beds (Figure 25.1). At some point from May through September 1, 19 countries will have high or extreme stress on intensive care unit (ICU) capacity (Figure 26.1).
Model updates

Figure 6.1: Estimated percent of the population infected with COVID-19 on May 2, 2022

Figure 7.1: Mean effective R on April 21, 2022. Effective R less than 1 means that transmission should decline, all other things being held the same. The estimate of effective R is based on the combined analysis of deaths, case reporting, and hospitalizations where available. Current reported cases reflect infections 11-13 days prior, so estimates of effective R can only be made for the recent past.
Figure 8.1: Percent of estimated COVID-19 infections detected. This is estimated as the ratio of reported daily COVID-19 cases to estimated daily COVID-19 infections based on the SEIR disease transmission model. Due to measurement errors in cases and testing rates, the infection-detection rate can exceed 100% at particular points in time.

Projections and scenarios

Figure 23.1: Daily COVID-19 infections until September 01, 2022 for three scenarios

Figure 23.2: Daily COVID-19 reported cases until September 01, 2022 for three scenarios
Figure 23.3: Daily COVID-19 hospital census until September 01, 2022 for three scenarios
Figure 23.4: Reported daily COVID-19 deaths per 100,000
Figure 23.5: Total daily COVID-19 deaths per 100,000
Figure 24.1: Comparison of reference model projections with other COVID modeling groups. For this comparison, we are including projections of daily COVID-19 deaths from other modeling groups when available, last model update in brackets: Delphi from the Massachusetts Institute of Technology (Delphi) [May 2, 2022], and the SI-KJalpha model from the University of Southern California (SIKJalpha) [May 2, 2022]. Regional values are aggregates from available locations in that region.
Figure 25.1: The estimated inpatient hospital usage is shown over time. The percent of hospital beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of beds occupied by COVID-19 patients. Less than 5% is considered low stress, 5-9% is considered moderate stress, 10-19% is considered high stress, and 20% or greater is considered extreme stress.
Figure 26.1: The estimated intensive care unit (ICU) usage is shown over time. The percent of ICU beds occupied by COVID-19 patients is color-coded based on observed quantiles of the maximum proportion of ICU beds occupied by COVID-19 patients. Less than 10% is considered low stress, 10-29% is considered moderate stress, 30-59% is considered high stress, and 60% or greater is considered extreme stress.
More information

Data sources:
Mask use and vaccine confidence data are from the The Delphi Group at Carnegie Mellon University and University of Maryland COVID-19 Trends and Impact Surveys, in partnership with Facebook. Mask use data are also from Premise, the Kaiser Family Foundation, and the YouGov COVID-19 Behaviour Tracker survey.

Genetic sequence and metadata are primarily from the GISAID Initiative. Further details available on the COVID-19 model FAQ page.

A note of thanks:
We wish to warmly acknowledge the support of these and others who have made our COVID-19 estimation efforts possible.
