

SUPPLEMENTARY METHODS ANNEX

Financing Global Health 2018
Countries and Programs in Transition

Version: April 23, 2019

Contents

SECTION 1. TRACKING TOTAL HEALTH SPENDING AND ITS COMPONENTS

Overview

Statistical model to fill missingness in health expenditure variables

SECTION 2. TRACKING DEVELOPMENT ASSISTANCE FOR HEALTH FROM TRADITIONAL DONORS

Overview

Tracking development assistance for health from bilateral aid agencies and the European Commission

Tracking development assistance for health from the development banks

Tracking contributions from the Global Fund and Gavi

Tracking expenditure by United Nations Agencies active in the health domain

Tracking development assistance for health from private foundations

Tracking non-governmental organizations

Calculating the technical assistance and program support component of development assistance for health from loan- and grant-making channels of assistance

References

SECTION 3: TRACKING DEVELOPMENT ASSISTANCE FOR HEALTH FROM CHINA, 1990–2018

SECTION 4. TRACKING TOTAL SPENDING ON MALARIA BY SOURCE IN 106 COUNTRIES, 2000–2016

Currency conversion

Government health expenditure as a source on malaria

Data

Modeling government expenditure on malaria patient care

Modeling total government expenditure on malaria

Out-of-pocket expenditure on malaria

Price-volume model

Modeling total out-of-pocket expenditure on malaria

Prepaid private expenditure on malaria

Malaria elimination status of the 106 countries

Data density

Probabilistic sensitivity analysis

References

SECTION 5. TRACKING POTENTIAL FOR ADDITIONAL GOVERNMENT SPENDING ON HIV/AIDS IN 137 LOW- AND MIDDLE-INCOME COUNTRIES, 2000 THROUGH 2016

Overview

Currency conversion

Modeling HIV/AIDS spending with ST-GPR

Enforcing internal consistency

Estimating potential government spending

Development assistance for health

Stochastic frontier analysis model selection

Comparison of potential spending to the literature

Results in purchasing price parity

References

SECTION 6. FORECASTING HEALTH SPENDING FROM 2017 TO 2050

Data

Covariates

Ensemble modeling

Package and architecture

Inclusion and exclusion criteria

Creating the forecasts

Ad-hoc draws correlation

Future health scenarios

Tables and figures

Abbreviations

ADB	Asian Development Bank
AfDB	African Development Bank
CRS	Creditor Reporting System
DAC	Development Assistance Committee
DAH	Development assistance for health
EC	European Commission
GDP	Gross domestic product
GGHE	General government health expenditure
GHED	Global Health Expenditure Database
GHES	Government health spending (Aggregate of “Social insurance contributions,” “Transfers from government domestic revenue [allocated to health purposes],” and “Compulsory prepayment [Other, and unspecified, than FS.3]” as defined in GHED)
HSS	Health systems strengthening
IBRD	International Bank for Reconstruction and Development
IDA	International Development Association
IDB	Inter-American Development Bank
LCU	Local currency units
NASA	National AIDS Spending Assessments
NGO	Non-governmental organizations
NHA	National Health Accounts
NPISH	Non-profit institutions serving households
ODA	Official development assistance
OECD	Organisation for Economic Co-operation and Development
OOP	Out-of-pocket (defined in GHED: “Other revenues from households n.e.c.”)
PAHO	Pan American Regional Office for WHO
PI	Private insurance
PPP	Pre-paid private (Aggregate of “Voluntary prepayment,” “Other revenues from corporations n.e.c.,” and “Other revenues from NPISH n.e.c.” as defined in GHED)
SHA 2011	System of Health Accounts 2011
SWAps	Sector-wide approaches
TB	Tuberculosis

THE	Total health expenditure (defined in GHED: “Current health expenditure by revenues of health care financing schemes”)
UNICEF	United Nations Children’s Fund
UNAIDS	Joint United Nations Programme on HIV/AIDS
UNFPA	United Nations Population Fund
VolAg	Report of Voluntary Agencies
WHO	World Health Organization

Overview of GHED data cleaning process

We used Global Health Expenditure Database (GHED) data from the World Health Organization (WHO) to generate our estimates.¹ From the GHED, we extracted “Current health expenditure by revenues of health care financing schemes” for total health expenditure (THE), “Other revenues from households n.e.c.” for out-of-pocket (OOP), and “Gross Domestic Product” for GDP. We summed “Social insurance contributions,” “Transfers from government domestic revenue (allocated to health purposes),” and “Compulsory prepayment (Other, and unspecified, than FS.3)” for government health spending (GHE). We summed “Voluntary prepayment,” “Other revenues from corporations n.e.c.,” and “Other revenues from NPISH n.e.c.” for prepaid private (PPP).

To ensure we used the best possible data from the GHED, we evaluated the metadata also provided by GHED to establish the reliability of the data. To do so, we downloaded the metadata from the GHED website for each data point for the five indicators. We used the metadata to decide how each given data point should be weighted, from 0 to 5, with 0 meaning drop, and 1 through 5 meaning keep, and treated these weights as inverse variance weights.

To assign the weights, we established guidelines for the metadata that informed how the underlying data points should be weighted. We gave priority to factors such as complete, documented source information and penalized factors such as having been derived or estimated. eTable 1 below describes the guidelines we created; any metadata that did not meet any of the disqualifying factors were given a value of 5 to reflect highest reliability.

We used the four primary metadata variables from the GHED database: data type, method of estimation, comments, and sources. We applied the guidelines to each unique set of metadata across these four variables. For a subset of data points, the metadata indicated that the data point was the sum of other data points. In these cases, if the indicator was a sub-indicator of GHES, PPP, or OOP, we assigned the data

point a value of 2 to reflect that even though we could not determine if the sub-components existed, as they are not reported in GHED, we did not feel that being a sum warranted dropping the data. We assigned the summed GHES, PPP, and OOP indicators the lowest value of its sub-indicators. If the summed data point was THE, however, we assigned the data point the lowest value of its sub-components, the summed GHES, PPP, and OOP indicators.

After designating each of the 3,005 unique sets of metadata a value weight, we applied these weights to the underlying data points. In total, we had 16,716 data points, as multiple data points shared the same unique set of metadata. Once the weights were applied to the data, we reassigned all high-income country data points that were a 0 based on the metadata to 3. We made this change to reflect that high-income countries have higher-quality data and thus should not be dropped, but should also not be given the highest weight value. The high-income classification comes from the World Bank.² The relative weighting scores for all countries across all years of data can be seen in eTable 2.

Each component of health expenditure was aggregated for all component-year-country combinations by taking component values (downloaded in current national unit); dividing by GHED-reported GDP for the corresponding year-country (also in current national unit) to convert each component into its fraction of GDP; and finally multiplying those fractions by IHME GDP series measured in USD 2018. (Note: though we harvested and cleaned metadata for THE and GDP, we do not model THE [we model GHE, PPP, OOP, and then aggregate] or use WHO's GDP data since we have our own methods with multiple sources for determination of our value).

Each component of health expenditure was then converted into three spending metrics for the time period between 1995 and 2016, measured in purchasing power parity (PPP): health spending per capita (\$), annualized rate of change in health spending per capita 1995–2016 (%), and annualized rate of change in health spending 1995–2016 (%). These metrics are shown below in Table 1. Then, each component of health expenditure was aggregated and converted into six spending metrics for the time period between 2017 and 2050, measured in PPP: health spending per capita (\$), annualized rate of change in health spending per capita 2017–2050 (%), annualized rate of change in health spending 2017–2050 (%), Government health spending per capita (\$), difference between GHEpc (government health expenditure per capita) reference scenario and better scenario 1, 2050 (\$), and difference between GHEpc reference scenario and better scenario 2, 2050 (\$). Table 2 contains these values.

Currency exchange and deflation

To convert a metric (for example, DAH) from 2018 USD to 2018 PPP, the following steps were taken: First, we used the US deflator series to convert the series (DAH as example) from 2018 USD to nominal USD series for all country-years. Next, we converted the nominal USD series to nominal LCU (local currency unit) series by multiplying with country-year-specific USD to LCU exchange rates, after which, we used country-year-specific deflator series (based to year 2018) to convert from nominal LCU to 2018 LCU series. Finally, we converted from 2018 LCU to 2018 PPP (purchasing power parity) series using the country-specific 2018 LCU to PPP conversion series. The source of country-year-specific USD to LCU exchange rates is the OECD exchange rate database.⁴

eTable 1. Rules for assigning weight values to metadata

Data type	Methods of estimation	Sources and/or comments	Weight
Blank			0
Estimated			0
	Derived by applying the sum of the components		Lowest weight of the components
	Interpolated but with additional information		2
	Method description is unclear or provides very little information		0
	Time trend interpolation		1
	Uses data from other countries		0
		Abstract that's not from something documented	1 or method (whichever is bigger)
		Adjusted	0 or method (whichever is bigger)
		Adjusted using something	2 or method (whichever is bigger)
		Any suggestion that WHO is unclear or unsure about some aspect of the data point's metadata	0 or method (whichever is bigger)
		Approximation	0 or method (whichever is bigger)
		Assumption	0 or method (whichever is bigger)
		Both blank	0 or method (whichever is bigger)
		Both with no intelligible information	0 or method (whichever is bigger)
		Budget address	1 or method (whichever is smaller)
		Calculation was used to generate the estimate	1 or method (whichever is bigger)
		Consultation/contact (without an additional documented source)	1 or method (whichever is smaller)
		Consultations with additional source, but no specifics and just consult is documented	1 or method (whichever is bigger)
		Currency conversion	1 or method (whichever is bigger)
		Data delivered/provided/reported by (a non-documented source)	1 or method (whichever is smaller)
		Data provided but not clear by whom, with an additional source if additional source is not documented	1 or method (whichever is smaller)
		Derived	0 or method (whichever is bigger)
		Estimated based on	1 or method (whichever is bigger)

Data type	Methods of estimation	Sources and/or comments	Weight
		Estimation	0 or method (whichever is bigger)
		Excludes (if it excludes what we do want)	0 (supersedes method)
		Extrapolated	0 or method (whichever is bigger)
		Forecasted	0 or method (whichever is bigger)
		Government department, no explicit documented source	1 or method (whichever is bigger)
		Government ministry, but no explicit documented source	1 or method (whichever is bigger)
		Includes (if it includes what we don't want)	0 (supersedes method)
		Inferred	0 or method (whichever is bigger)
		Interpolation	0 or method (whichever is bigger)
		Missing (if missing something that should be included)	0 (supersedes method)
		Modified	0 or method (whichever is bigger)
		Modified from something/modified using something	2 or method (whichever is bigger)
		Needs assessment	1 or method (whichever is smaller)
		Needs discussion	1 or method (whichever is smaller)
		Needs validation	1 or method (whichever is smaller)
		Needs verification	1 or method (whichever is smaller)
		Only provides hint of a source	1 or method (whichever is smaller)
		Projected	0 or method (whichever is bigger)
		Provides only a vague term that does not provide adequate information to infer or determine what the source is	0 or method (whichever is bigger)
		Reply	1 or method (whichever is smaller)
		Response	1 or method (whichever is smaller)
		Speech	1 or method (whichever is smaller)
		Sum of	2 (except for THE, which is lowest weight of components)
		Total of	3 (except for THE, which is lowest weight of components)
		Underestimated	0 (supersedes method)
		Unpublished	1 or method (whichever is smaller)
		Validated figures, but without specifics	2 or method (whichever is bigger)
		Weights	0 or method (whichever is bigger)

Statistical model to fill missingness in health expenditure variables

After the cleaning up of the data previously described above, we used spatiotemporal Gaussian process regression (ST-GPR) in order to predict and fill out the missingness that existed in the resulting health expenditure dataset. ST-GPR is a stochastic modeling technique designed to detect signals amid noisy data. It also serves as a powerful tool for interpolating non-linear trends. Unlike classical linear models that assume that the trend underlying data follows a definitive functional form, GPR assumes that the specific trend of interest follows a Gaussian process, where each point can be estimated with a mean and covariance function.

The first step to implementing ST-GPR is to identify relevant covariates that would be helpful in predicting each health expenditure variable of interest. Using the following set of covariates, we estimated the first stage of the process (space-time) in order to predict and fill up the dependent variables. The covariates used are:

- a) All-sector government expenditure per capita, logged
- b) Healthcare Access and Quality Index, logged
- c) Proportion of total population above the age of 65, logit transformed.

where the dependent variables were logs of GHE per capita, PPP per capita, and OOP per capita.

Given the weight of data, we were able to adjust the weight of each data point that contributed to the likelihood function of the Gaussian process, by inflating the pointwise variance for data points with lower weights. For missing data points, the resulting uncertainty was determined by region-specific estimates. The final resulting dataset was a complete set of GHE, PPP, and OOP per capita estimates for 195 countries from 1995 through 2016, where the uncertainty around each point was constructed by simulating from a normal distribution. Goodness-of-fit was determined using out-of-sample validation and choosing the models with the best-performing set of hyperparameters. Overall, ST-GPR is a stochastic modeling technique that performs well at detecting signals among datasets that are noisy. It deviates from classic linear models that assume the trend of its underlying data must follow a definitive functional form. Instead, GPR assumes the trend must follow a Gaussian process form, having a covariance function and a pointwise mean. For the distribution of the Gaussian process, we used a Matérn covariance matrix. GPRs were run repeatedly to ensure that every country-year estimate per metric had 1,000 draws. This ST-GPR process follows the same form of that found in the Global Burden of Disease Study 2017 appendix.³ This analysis was conducted in the following programs: Stata (version 13.1) and R (version 3.5.1).

eFigure 1 below shows the comparison of WHO GHED extracted data and IHME ST-GPR THE in GDP per capita space from 2000 to 2016. eFigure 2 shows the comparison of WHO GHED extracted data and IHME ST-GPR THE in per GDP space from 2000 to 2016.

eFigure 1. Comparison of WHO GHED extracted and IHME ST-GPR THE in GDPpc space, 2000–2016

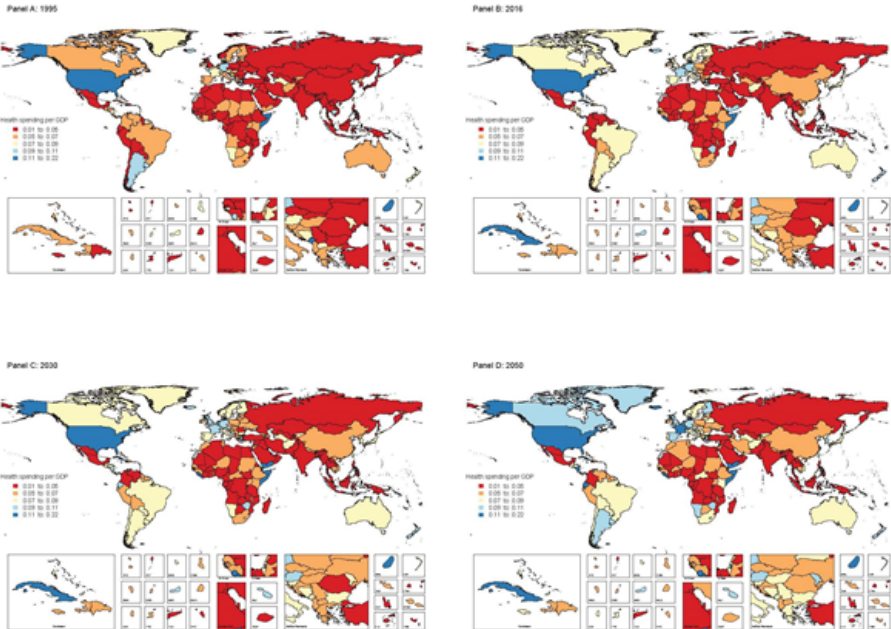

eFigure 2. Comparison of WHO GHED extracted and IHME ST-GPR THE *in per GDP* space, 2000–2016

To make results in terms of percentage of GDP evident, we have added new versions of Figures 1, 2, 3, and 8, remade using percentage of GDP rather than US dollars below. They have been added as eFigures 3, 4, 5, and 6, respectively.

Overview

Development assistance for health (DAH) estimates were obtained from the Institute for Health Metrics and Evaluation's development assistance for health database. We summarize the original methodology as well as updates for this year's estimates below. A more detailed description of the original methodology used to obtain the estimates in the database can be found in Dieleman et al.¹ All known, systematically reported, available data on health-related disbursements and expenditures were extracted, as well as income and revenue from existing project databases, annual reports, and audited financial statements. The channels included and the corresponding data sources are summarized in eTable 2. Data sources obtained via personal correspondence are summarized in eTable 3.

DAH for bilateral agencies included all health-related disbursements from bilateral donor agencies, excluding funds that they transferred to any of the other channels we tracked in order to avoid double-counting. This information was extracted from the Creditor Reporting System (CRS) and Development Assistance Committee (DAC) databases of the Development Assistance Committee of the Organisation for Economic Co-operation and Development (OECD-DAC). In some cases, donor agencies did not report disbursement data to the CRS. A method for predicting disbursements from commitment data was implemented to address this challenge. For a detailed description of this method, see Tracking Development Assistance for Health from Bilateral Aid Agencies and the European Commission section below, as well as in Dieleman et al.¹

For other grant- and loan-making institutions, annual disbursements on health grants and loans were similarly included, excluding transfers to any other channels and ignoring any repayments on outstanding debts. For a more detailed description of this process see Dieleman et al.¹ The annual disbursements for grant- and loan-making institutions only reflect the financial transfers made by these agencies. Therefore, in-kind transfers from these institutions in the form of staff time for providing technical assistance and the costs of managing programs were estimated separately.¹

Estimates of DAH for the United Nations (UN) agencies included annual expenditures on health both from their core budgets and from voluntary contributions. Calculating DAH for the United Nations Children's Fund (UNICEF) involved estimating the fraction of its total expenditure spent on health prior to 2001.¹

Non-governmental organizations’ (NGOs) DAH estimates utilized data from US government sources, Guidestar Research Fundamental Plus dataset, and a survey of health expenditure for a sample of NGOs to estimate DAH from US-based and internationally based NGOs receiving support from the US government. We were unable to include other NGOs due to the lack of audited and comparable data.

The database also included an analysis of the composition of health funding by recipient country, health focus area, and program area. In this round of updates to the databases we have made several important improvements. Among these improvements are the inclusion of China as a bilateral source of funding, the inclusion of European Economic Area and Coalition for Epidemic Preparedness Innovations as disbursing agencies of DAH funding, the addition of new program areas – antimicrobial resistance/drug resistance under the HIV/AIDS, tuberculosis, malaria, and other infectious diseases health focus areas, the disaggregation of human resources for health within the sector-wide approaches and health systems strengthening (HSS/SWAp)s health focus area, and modifications to our health focus area keyword search terms. All methodological updates made are detailed in their relevant channel sub-section below. The improvements to our health focus area keyword search terms are detailed in eTable 5 and in the section below titled “Disaggregation by health focus area,” respectively.

For many channels, reporting-time lags prevent primary disbursement data for the most recent year(s). For those years, the values of DAH were predicted, using channel-specific time trends. The methods employed to obtain these predictions are summarized in eTable 4. In general, these methods depend on data availability. The estimates are based on channel-specific budget, commitment, and appropriations data, and in many cases assume the most recent disbursement patterns persist. Due to the lack of more detailed disaggregated data, estimates for the most recent year are not provided for recipient countries.

We predicted Ebola funding in 2018 for bilateral sources and the European Commission by assuming that 2018 Ebola funding was equal to 2017 Ebola funding.

In addition, for HSS/SWAp)s funding, we allocated HSS/SWAp)s projects with multiple health focus areas identified by a proportional allocation based on the relative proportions of the project going to the various health focus areas.

For countries that only began existing in certain years, we backcasted DAH in years before their existence as follows: For countries that split off from parent countries, we calculated a three-year average ratio of child country DAH received to parent country DAH received. In years before the child country split off, DAH received by the parent country would have included DAH received in the region that would split off to become the child country. Therefore, we reallocated funding from the parent country, in all years before the child country split off, adding this proportion of the parent country’s DAH to the child country’s DAH and subtracting out this value from the parent country’s DAH. By this method, total annual DAH between the parent and child country do not change, but the allocation of funding between the parent country and child country change. For any country that ceased to exist (such as former Yugoslavia and former USSR) and that had observed DAH received in certain years, we split the funding equally among its new constituent countries.

Currency exchange and deflation

All results are presented in real 2018 US dollars. All disbursement sequences were converted into real 2018 US dollars by taking disbursements in nominal US dollars in the year of disbursement and adjusting these sequences into real 2018 US dollars using US gross domestic product (GDP) deflators. Analyses were conducted in Stata (version 13.1).

* Years of budget data used for modeling versus years underlying DAH data unavailable thus modeled: The data used to estimate DAH by channel vary across channels. eTable 2 reports our primary data used for each channel. Due to reporting lags there are some years we need to estimate disbursement using additional data sources. These additional data sources, the years in which the primary data are modeled, the years the additional data are available, and the methods for this estimating these modeled years are reported in eTable 4. Years of budget data used for modeling are the years of additional data available to us. We rely on historical trends to inform our estimates, so we rely on many years of additional data despite only modeling a few years of primary data. Years underlying DAH data unavailable thus modeled are the years the primary data are incomplete and thus estimated using additional data. See example below for more details for Australia.

Box 1. EXAMPLE - Australia's primary and additional data sources

Project-level data for health-related projects funded by Australia's bilateral aid agencies are available from the OECD's CRS database through 2017. This is the primary data source used to estimate DAH channeled by Australian aid agencies, as described in eTable 2. 2018 is incomplete because of lags in reporting. To estimate DAH disbursed for 2018, additional data are available from Australia's International Development Assistance budget (2008–2018) and Australia's Overseas Aid Program budget (1998–2008), as described in eTable 4. These sources provide health-specific official development assistance (ODA) budgeted by Australia, 1998–2018. We convert countries' budgeted ODA, as given in nominal local currency units, to nominal US dollars using the OECD's currency exchange rate series based on USD monthly averages. To estimate DAH disbursed in 2018, we calculated the ratio of disbursed DAH (from the CRS database) relative to budgeted DAH (from the International Development Assistance and Overseas Aid Program budgets) for 1998–2017. We combine the most recent three ratios into a single estimate by taking a weighted average, weighting substantially higher the most recent year. We multiply this ratio – the estimated disbursed DAH to budgeted DAH – by the 2018 budgeted DAH to estimate disbursed DAH in those years. These methods are described more fully in Dieleman et al.¹

DISAGGREGATING BY HEALTH FOCUS AREA

We improved our analysis of the disaggregation of health funding by health focus areas by augmenting our keyword search terms. In particular, we added new keywords to the antimicrobial resistance/drug resistance program area of HIV/AIDS, tuberculosis, malaria, and other infectious diseases health focus areas and human resources for health program areas as well as updated the keywords in all other health focus areas and program areas. Similar to our previous work, the analysis of health focus areas included assessments of development assistance for HIV/AIDS, tuberculosis (TB), malaria, reproductive and maternal health, newborn and child health, other infectious diseases, non-communicable diseases, and health systems strengthening/SWApS, using keyword searches within descriptive fields. These were chosen as the areas of focus because of their relevance to current policy debates about global health financing and data availability.

In effect, DAH was disaggregated into eight health focus areas: HIV/AIDS; tuberculosis; malaria; reproductive, maternal, newborn and child health; non-communicable diseases; health systems strengthening/SWApS; other infectious diseases; and other. For most data sources, project-level data were available only through 2017. Methods to estimate health focus area allocations for 2018 are described in more detail below. Keyword searches were performed for a subset of global health channels that provide project-level data with project titles or descriptions. These sources include the bilateral development assistance agencies from 24 DAC member countries, one DAC participant country, the Global Fund, the World Bank, the Asian Development Bank, the African Development Bank, the Inter-American Development Bank, the Bill & Melinda Gates Foundations, non-governmental organizations, US foundations, the Wellcome Trust, and the European Economic Area. The keywords used are outlined in eTable 5 below. Descriptive fields were adjusted so that they were all in capitalized letters, special characters were modified, and search terms with multiple words were put between quotation marks. All keywords were translated into nine major languages (English, Spanish, French, Portuguese, Italian, Dutch, German, Norwegian, and Swedish) used in the OECD CRS, checked for double meanings across all languages, and adjusted accordingly.

Total DAH was split across the health focus areas using weighted averages based on the number of keywords present in each project's descriptive variables. If, for example, three keywords suggested the project focused on HIV/AIDS and two keywords related to tuberculosis were also tagged, three-fifths of the project's total DAH was allocated to HIV/AIDS and two-fifths was allocated to tuberculosis. To account for the sensitivity of this method, several checks were implemented after the keyword searches to ensure the project was accurately categorized. First, projects that were tagged as child and newborn vaccines and other infectious diseases were categorized as child and newborn vaccines only. Second, projects that were tagged as one of the three major infectious diseases (HIV/AIDS,

tuberculosis, or malaria) and other infectious diseases were categorized under only HIV/AIDS, tuberculosis, or malaria.

Box 2. EXAMPLE. Post-keyword search weighting

A project in the CRS database had a value of \$1,000 of DAH. A keyword search conducted on this project's title and description tagged five keywords: 3 keywords related to HIV/AIDS and 2 keywords related to tuberculosis. Therefore, \$600, or 3/5 of total DAH, was allocated to HIV/AIDS, while \$400, or 2/5 of total DAH, was allocated to tuberculosis.

In addition to keyword searches, funds were allocated to health focus areas based on characteristics of the channel or additional channel variables. For the bilateral agencies and the EC, purpose codes from the CRS were used to supplement keyword searches. For the World Bank-IDA and -IBRD, health focus areas were also determined by the project sector codes and theme codes, which included percentages of health funds that targeted each theme. All funds from Gavi were allocated to child and newborn vaccines, health systems strengthening and non-communicable diseases and all funds from UNICEF to maternal, newborn, and child health, unspecified. Funds from the Global Fund were distributed to malaria, HIV/AIDS, TB, and health systems strengthening based on disease components. Within each disease component, keyword searches on programmatic budget data and project descriptions were conducted to distribute among program areas. Funds from UNAIDS were allocated to HIV/AIDS, and specific program areas were determined by budget information. UNFPA, PAHO, and WHO funds were allocated to specific health focus areas based on project expenditure data from their annual reports and annual financial reports. For all channels, projects listed as HIV/TB were distributed evenly among the two health focus categories. See eTable 6 below for more details on these categorizations.

Disaggregating preliminary estimates by health focus area

Estimates by health focus area for years in which descriptive data were not available (usually 2018) were obtained by modeling channel-specific DAH per health focus area as a function of time. Out-of-sample validation was used to test the predictive accuracy of a large suite of models, estimating the models using 1990–2010 data and predicting 2011 and 2012. The potential models included fractional multinomial logit regression, OLS regression, autoregressive integrated moving average (ARIMA) models, Epanechnikov kernel-weighted local polynomial smoothing, and multivariable fractional polynomial models. For each model, time was modeled linearly, with splines, and by including lag-dependent variables. Other methodologies considered included modeling health-focus-area-specific DAH as a dollar amount and as a fraction of the channel-specific total DAH. Lastly, models that involved transforming the dependent variable in natural log and logit transformed space were considered. In order to accommodate zero values in the logit transformation, the transformation described in Smithson and Verkuilen were applied.⁷³ Over 40 models and specifications were evaluated in total.

Each of the potential models and specifications described above were estimated using data from 1990 through 2010, and then the estimated model was used to predict DAH by health focus area for 2011 and 2012. Since we have DAH estimates for 2011 and 2012, we compared the modeled estimates and the observed estimates and calculated average percentage deviation and average total absolute deviation for each model and specification across all the channels and health focus areas. A variant of the Epanechnikov kernel-weighted local polynomial smoothing had the smallest average percentage deviations and average total absolute error. In this model and specification, health focus area-specific DAH fractions were independently estimated at the channel level after they were logit transformed. Time was the only independent variable included in the model. The health focus area-specific DAH estimates were adjusted so the sum of the channel’s health focus area disbursements totaled channel-specific DAH envelope. Our preferred model, the Epanechnikov kernel-weighted local polynomial smoothing, minimized both the average percentage deviation and the total absolute error out of sample, predicting two years ahead. See Dieleman et al. for a table that demonstrates the performance of four models, each with their optimal specification (as determined by the out-of-sample average percent deviation and total absolute error).¹

Tracking development assistance for health from bilateral aid agencies and the European Commission

OECD-DAC maintains two databases on aid flows: 1) the DAC annual aggregates database, which provides summaries of the total volume of flows from different donor countries and institutions, and 2) the CRS, which contains project- or activity-level data.³ This year, we used the DAC databases to track health ODA from 24 OECD-DAC members (Austria, Australia, Belgium, Canada, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Japan, Luxembourg, the Netherlands, New Zealand, Norway, Portugal, South Korea, Spain, Sweden, Switzerland, the United Kingdom, the United States, and the EC), and one DAC participant country, United Arab Emirates, for the years 1990 to 2018. Observed data for the DAC members were available from 1990 to 2017, and observed data for the United Arab Emirates were available from 2009 to 2017. United Arab Emirates bilateral health ODA from 1990 to 2008 was obtained through personal correspondence.

These two DAC databases track the following types of resource flows:

Official development assistance (ODA), defined as “flows of official financing administered with the promotion of the economic development and welfare of developing countries as the main objective”⁶⁹ is tracked from its 30 members (Austria, Australia, Belgium, Canada, Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Japan, Luxembourg, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, the United Kingdom, the United States, and the EC). The CRS also now includes some private ODA, such as that funded by the Gates Foundation and the Global Fund, as well as assistance from a number of non-DAC countries such as the United Arab Emirates and Kuwait.

ODA includes:

- Bilateral ODA, which is given directly by DAC members as aid to recipient governments, core contributions to NGOs and public-private partnerships, and earmarked funding to international organizations.
 - Multilateral ODA, which includes core contributions to multilateral agencies such as WHO, UNFPA, the Global Fund, Gavi, UNAIDS, UNICEF, PAHO, the World Bank, and other regional development banks. Only regular budgetary contributions to these institutions can be reported to the OECD-DAC; hence, extrabudgetary funds, including earmarked contributions that donors can report as bilateral ODA, are not included as multilateral ODA. Only 70% of core contributions to WHO can be counted as multilateral ODA.
- a. Official development finance (ODF), which includes grants and loans made by multilateral agencies.
- b. Other official flows (OOF), which refers to transactions that “do not meet the conditions for eligibility as Official Development Assistance or Official Aid, either because they are not primarily aimed at development, or because they have a Grant Element of less than 25 percent.”

The DAC aggregate tables include all multilateral development banks, the Global Fund, operational activities of UN agencies and funds, and a few other multilateral agencies. The project-level data in the CRS cover a smaller subset of multilateral institutions, including UNAIDS, UNFPA, UNICEF, public-private partnerships including Gavi and the Global Fund, some development banks, and the Gates Foundation, but do not reflect the core-funded operational activities of WHO prior to 2009, disbursements by Gavi prior to 2007 and the Gates Foundation prior to 2009, or all loans from the World Bank.

This research utilized the CRS as the principal source for tracking bilateral DAH. This is because the DAC aggregate tables do not report detailed project-level information about the recipient country and health focus area. The OECD sector codes for general health (121), basic health (122), and population programs (130) were used to identify health flows in the CRS. Only ODA-related flows are used in our analysis, including OECD flow codes corresponding to ODA grants (11), ODA grant-like (12), ODA loans (13), and equity investment (19). In addition, we included select projects with OECD sector code for emergency aid (720) in order to capture additional funding for Ebola and Zika outbreaks. Projects with purpose code emergency food aid (72040) were excluded, and the remaining project descriptive variables were parsed for the keywords “EBOLA” and “ZIKA” to identify emergency aid projects targeting these diseases. Based on our definition of DAH, we also excluded any remaining projects containing any of the following keywords: " WATER " " SANITATION " " FOOD " " EARTHQUAKE " " HURRICANE " " TERREMOTO " " HURACAN " " FAMILY CARE STRUCTURES " .

To avoid double-counting, all identifiable earmarked commitments and disbursements between one disbursing agency to another were tagged and removed before calculating final DAH estimates. Income statements, expenditure statements, and keyword searches in the descriptive project fields were used to identify potential sources of double-counting.

In multilateral agencies, public-private partnerships, development banks, and foundations, when expenditure by recipient agency information was available, double counting was tagged and dropped in the disbursing agency from whom the resources were transferred. In the absence of detailed expenditure data in the

disbursing agency that transferred resources, the income statement of the receiving disbursing agency that reflected the disbursement was used to flag the disbursement in the initial disbursing agency. Preliminary estimates were generated based on the annual disbursed envelope exclusive of resources flagged as transfers to other agencies.

Channel codes in the CRS data were used to track DAH to international and donor-country-based non-governmental organizations. The names of NGOs that were captured in IHME's NGO data (as detailed in the section titled "Tracking non-governmental organizations") were searched for in the CRS descriptive variables and tagged as double-counting. Research funds for HIV/AIDS channeled by the US government through the National Institutes for Health (NIH) were also removed from the total since they do not meet the definition of DAH as contributions from institutions whose primary purpose is development assistance. Official development finance (ODF) from the CRS was not counted because these expenditures were included elsewhere, either in the analysis of multilateral institutions relevant to the study or in the assessment of health spending by the Gates Foundation, the data for which were obtained via correspondence and from their annual reports, audited financial statements, and project databases. To avoid double-counting, only health assistance flows from multilateral institutions to low- and middle-income countries were counted, and not transfers to multilateral institutions. Also, for regional projects the disbursements are split among all countries in the specified OECD region. For example, a project allocated to recipient "North of Sahara, regional" would have its disbursements split equally between all the countries in the corresponding OECD region: Algeria, Egypt, Libya, Morocco, and Tunisia.

Allocation of funding to health focus areas was assigned as described in the section "DISAGGREGATING BY HEALTH FOCUS AREA," based on a keyword search of five descriptive variables in the CRS: project title, short description, long description, channel name, and channel reported name. Additional adjustments were made based on CRS purpose codes, as detailed in eTable 6, in order to ensure that the specified purpose corresponded to the highest-weighted health focus area.

Estimating disbursements for the 24 bilateral channels and the EC

Both the DAC tables and the CRS rely on information reported by DAC members and other institutions to the OECD-DAC. Hence, the quality of the data varies considerably over time and across donors. Three variables were used to estimate yearly donor disbursements: CRS commitments, CRS disbursements, and DAC commitments. There were two main challenges in using the data from the CRS for this research:

1. underreporting of aid activity to the CRS compared to what is reported to the DAC, and
2. underreporting of disbursement data to the CRS compared to commitment data reported to the CRS.

These issues are highlighted in eFigure 1. Methods developed to account for both these challenges are discussed below. Details on how we estimated the cost of providing technical assistance and program support for these institutions are highlighted below in the section titled calculating the technical assistance and program support component of development assistance for health from loan- and grant-making channels of assistance.

To address these two challenges, we determined a cutoff point for each channel. We defined this channel-specific cutoff year as when the ratio of total CRS disbursements to commitments was greater than 50% and did not drop subsequently below 30%. eFigure 2 below shows each donor's CRS disbursement to commitment ratio in green, and the estimated cutoff year is marked with a vertical red line. For years after the cutoff year, DAH is measured using the unadjusted disbursement data. For the time prior to the cutoff year, it was determined that the disbursement data are not of high enough quality, and adjusted commitments were used instead.

Two adjustments were made to commitments to estimate disbursements before each donor-specific cutoff point:

- I. The first adjustment addressed underreporting of aid activity to the CRS (relative to the DAC). To address this challenge, all CRS commitments for the health sector were adjusted upward using the DAC commitment to CRS commitment coverage ratio. The coverage ratio of the CRS was well below 10% before 1996 but has improved steadily over time.

- II. The second adjustment addressed underreporting of disbursements data to the CRS (relative to commitments reported to the CRS). To address this challenge, we pooled completed projects in the CRS that have disbursement data for each channel and computed yearly project disbursement rates (the fraction of total commitments disbursed for each year of a project) and overall project disbursement rates (the fraction of total commitments disbursed over the life of each project) by project length. Yearly disbursement schedules were calculated for projects with lengths of one, two, three, four, five, and six years. When an observed project length was more than six years, all expenditure after the sixth year was aggregated and assumed to be expended in the sixth year. This does not happen often. Yearly disbursement rates were the median of these shares, averaged across projects for every donor in each project year. The sum of these averages equals one, so that all the disbursements were expended over the lifetime of a project. We also adjusted donor disbursement schedules by the ratio of disbursements to commitments in the CRS in order to reflect the fact that not all commitments are typically disbursed. The product of these donor-specific yearly disbursement rates, the donor-specific overall disbursement rates, and the donor-specific disbursement to commitment ratios produced the donor-specific disbursement schedules. The donor-specific disbursement schedules were applied to project-level DAC-adjusted commitments reported in the CRS. eFigure 3 shows the yearly disbursement rates and overall disbursement rates for projects with one- to six-year lifespans for each of the 24 member countries and the EC.

Lastly, to address the challenge of underreporting of aid activity to the CRS compared to the DAC for all years, the difference between each donor's aggregate DAC health commitments and CRS health disbursements was added to each donor's yearly DAH. Since only aggregate commitments are reported to the DAC, several adjustments were made, based on more detailed CRS data:

- I. First, each donor's yearly median project length was calculated by applying the donor-specific disbursement schedules described above to CRS projects that had disbursement in order to get adjusted DAC commitments.
- II. Commitments for projects that have not opened yet were then subtracted, based on the open date reporting in the CRS. This ensured that future disbursements were not captured.
- III. The donor-specific ratio of disbursements to commitments was applied to adjusted DAC commitments in order to account for the fact that not all commitments are usually disbursed.
- IV. Lastly, these DAC-adjusted commitments were compared to CRS disbursements, inclusive of transfers that were later dropped as double-counting.

In addition to tracking disbursements from the EC, gross disbursements from the DAC were used to compile data on the sources of funding for the EC.

eFigure 1. Comparing CRS commitments, CRS disbursements, and DAC commitments

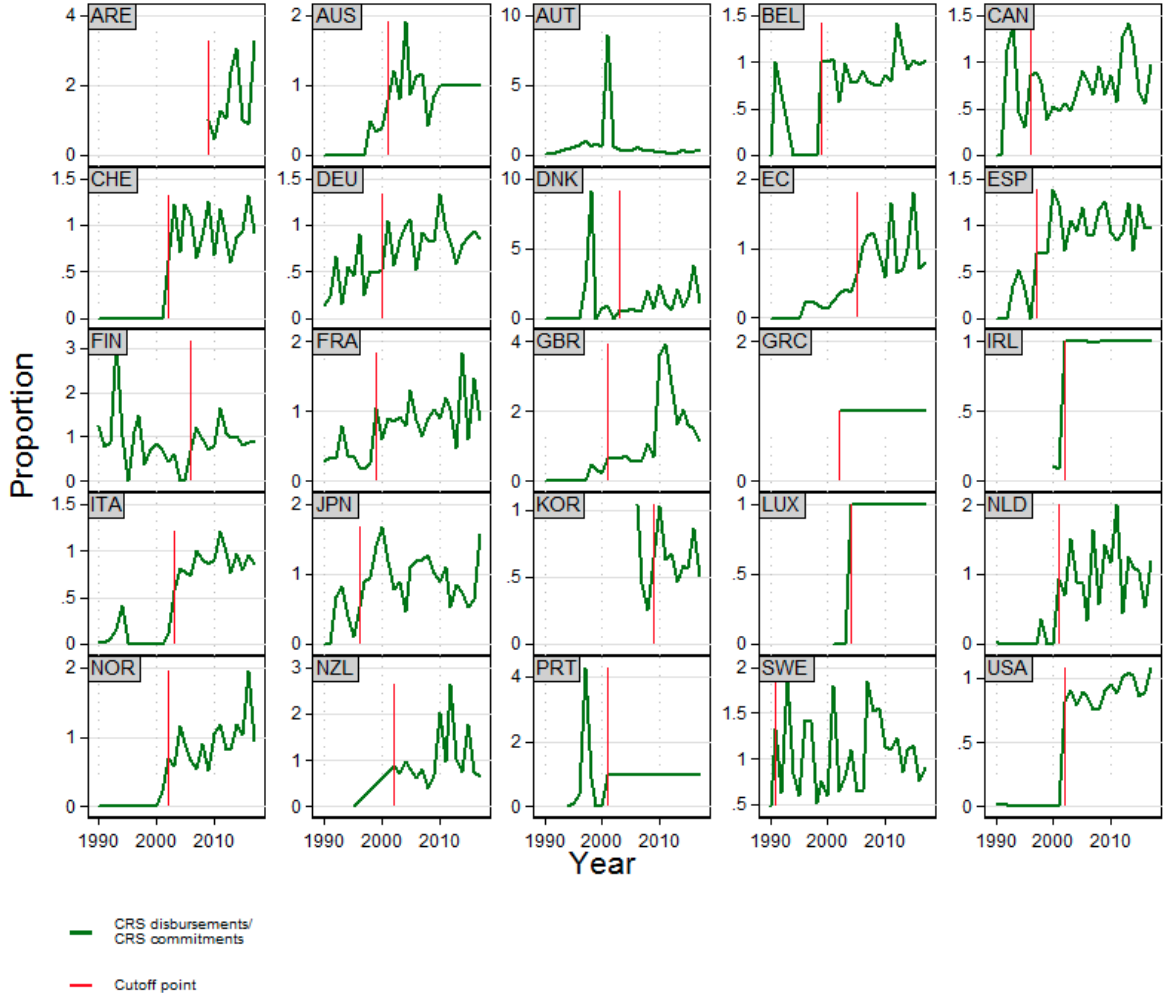

This figure compares commitments and disbursements from the Creditor Reporting System (CRS) and Development Assistance Committee (DAC) databases of the Development Assistance Committee of the Organisation for Economic Co-operation and Development (OECD-DAC) from 1990 to 2016. CRS disbursements are usually underreported when compared to both CRS and DAC commitments data, especially in earlier years. Because of this gap between CRS and DAC, CRS disbursements data were adjusted to fit DAC commitments data.

Source: OECD-DAC and OECD Creditor Reporting System

eFigure 2. CRS disbursement to commitment ratio and cutoff points by donor agency

This figure shows the channel-specific cutoff year. Before this year, we adjust CRS commitments using disbursement schedules. After this cutoff we rely on CRS-reported disbursements. The total CRS disbursements to commitments ratio is in green, and the cutoff year is marked with a vertical red line. The cutoff year is determined to be when the ratio goes above 50% and does not fall back below 30%. The vertical axis represents the CRS disbursement to commitment ratio as a percentage. ARE = United Arab Emirates, AUS = Australia, AUT = Austria, BEL = Belgium, CAN = Canada, CHE = Switzerland, DEU = Germany, DNK = Denmark, EC = European Commission, ESP = Spain, FIN = Finland, FRA = France, GBR = Great Britain, GRC = Greece, IRL = Ireland, ITA = Italy, JPN = Japan, KOR = South Korea, LUX = Luxembourg, NLD = the Netherlands, NOR = Norway, NZL = New Zealand, PRT = Portugal, SWE = Sweden, USA = United States of America

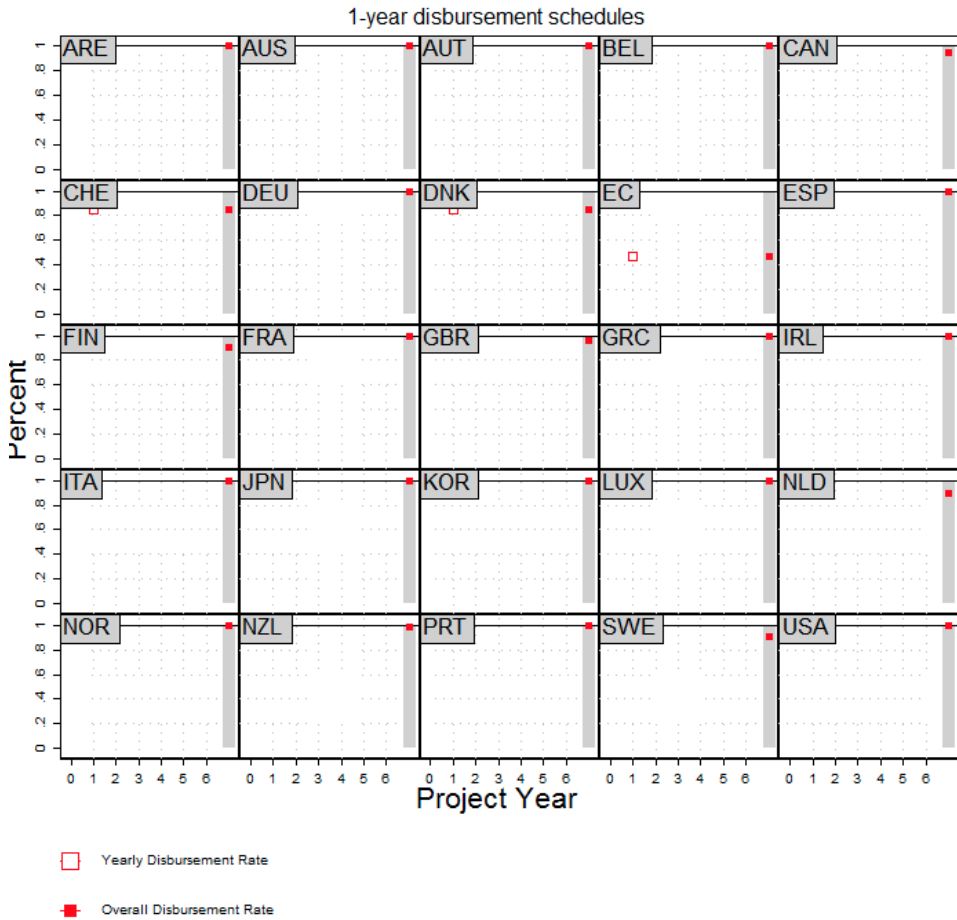

Source: OECD Creditor Reporting System

Box 3. EXAMPLE. Australia's CRS disbursement to commitment ratio and cutoff year

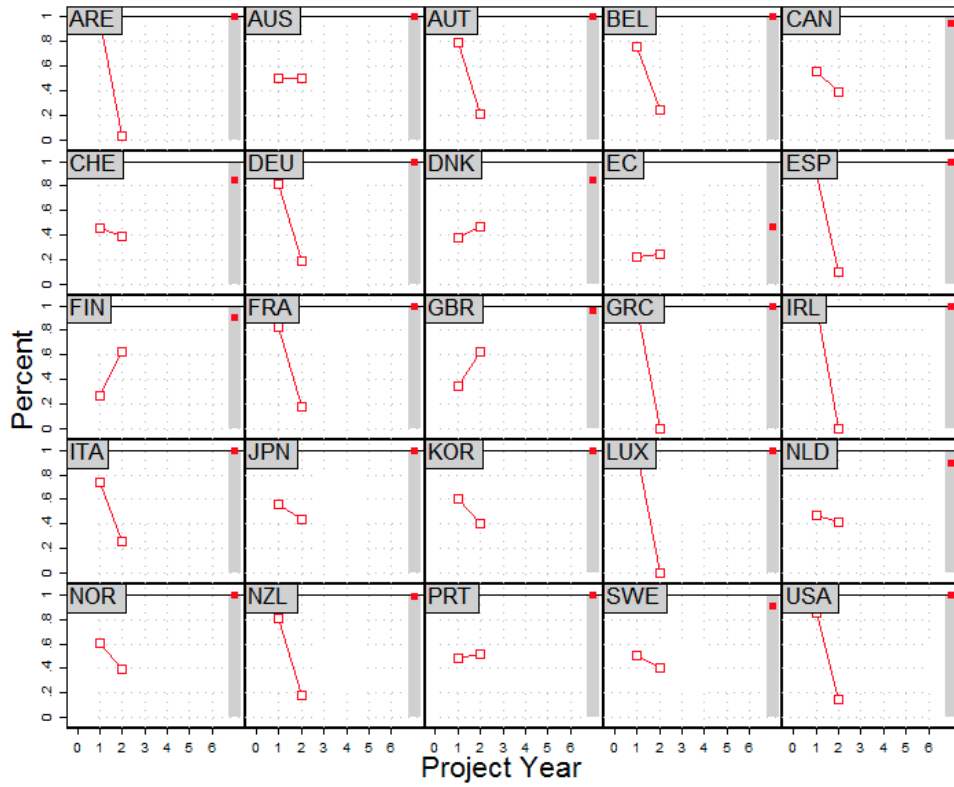

The green line shows the ratio of Australia's disbursements to commitments, as reported in the CRS. Prior to 2001, the ratio was always below 50%. In 2001, the ratio rose above 50%; it did not fall below 30% in subsequent years, thereby defining 2001 as the cutoff year. Thus, for Australia, before 2001, DAH is based on adjusted CRS commitment data. These data are adjusted using disbursements schedules (eFigure 3) and data from the DAC. After 2001, Australia's DAH is based on the disbursements reported in the CRS.

eFigure 3. One- to six-year disbursement schedules for bilateral channels

This figure shows the estimated disbursement schedules for bilateral channels. Before the channel-specific cutoff year, we rely on commitment data to inform our estimates of DAH. Commitment data are adjusted to reflect disbursements over time using schedules estimated from projects in the CRS that have both commitment and disbursement data. The vertical axis represents the percentage of the commitment disbursed. ARE = United Arab Emirates, AUS = Australia, AUT = Austria, BEL = Belgium, CAN = Canada, CHE = Switzerland, DEU = Germany, DNK = Denmark, EC = European Commission, ESP = Spain, FIN = Finland, FRA = France, GBR = Great Britain, GRC = Greece, IRL = Ireland, ITA = Italy, JPN = Japan, KOR = South Korea, LUX = Luxembourg, NLD = the Netherlands, NOR = Norway, NZL = New Zealand, PRT = Portugal, SWE = Sweden, USA = United States of America

Box 4. EXAMPLE. Australia’s one- to six-year disbursement schedules

To estimate disbursements using commitment data, we rely on disbursement schedules derived from CRS data that include both commitments and disbursements. Disbursement schedules are specific for each channel and the length of a project. These schedules also take into consideration the average amount of commitments for each channel that lead to disbursements. Across all Australian projects in the CRS with complete disbursements data, Australia disbursed 100% of the funds that it committed, as shown by the solid red dot on the right-hand side of the Australia panel (upper left corner of the first panel of eFigure 3). In projects with a length of one year, Australia disbursed 100% of the funds that it committed in that year. For two-year projects, Australia disbursed 50% of total disbursements in year one and 50% of total disbursements in year two. In projects with lengths of three years, Australia disbursed about 50% of total disbursements in year one and 23% and 27% of total disbursements in years two and three, respectively. This is estimated for projects ranging from one to six years. The disbursement schedules were applied to commitment data from the CRS to estimate disbursements for years prior to the cutoff year, which is 2001 for Australia.

To predict DAH for the recent years not reported in the CRS, budget data were extracted from a variety of sources. These data are listed in eTable 4. Global health budgetary data were utilized whenever possible, but these detailed data were available as a complete time series only for Australia and the United States. For all other bilateral channels, general ODA budgets were used. In order to predict DAH for 2018 for 24 bilateral agencies, the budget ratio for each donor was calculated by dividing DAH estimates by the corresponding budget data (ODA or global health). Budget ratios were projected using a weighted average of the previous three years (placing one-half weight on the one-year lagged ratio, one-third weight on the two-year lagged ratio, and one-sixth weight on the three-year lagged ratio), and this ratio was multiplied by the observed budgeted DAH for those same years. eFigure 4 plots the budget ratio for each bilateral channel. Budget data for the EC were inconsistent and did not match the disbursement series. Instead, DAH for 2018 was estimated based on trends in DAH for EC member countries. A weighted average was applied to the percentage change in DAH from 2016 to 2018 for all EC member countries. The weighting was based on each country’s total national contributions to the EC. These data were collected from the EC’s financial statements.⁷⁴ The weighted average was then applied to the EC’s 2017 DAH to forecast 2018.

eFigure 4. DAH as a percentage of corresponding budget data by bilateral agency

This figure shows the trend of the ratio of DAH measured as a share of budget data. Green dots indicate that a donor provided global-health-specific budget data, so in these cases the denominator is all global-health-specific budgeted data. The numerator is estimated DAH. Red dots indicate that a donor did not have global-health-specific budget data, so overall ODA budget data were used in calculating the DAH to budget ratios. The vertical axis represents estimated DAH as a fraction of corresponding budget data. ARE = United Arab Emirates, AUS = Australia, AUT = Austria, BEL = Belgium, CAN = Canada, CHE = Switzerland, DEU = Germany, DNK = Denmark, ESP = Spain, FIN = Finland, FRA = France, GBR = Great Britain, GRC = Greece, IRL = Ireland, ITA = Italy, JPN = Japan, KOR = South Korea, LUX = Luxembourg, NLD = the Netherlands, NOR = Norway, NZL = New Zealand, PRT = Portugal, SWE = Sweden, USA = United States of America

Source: IHME DAH Database (2018) and corresponding bilateral ODA/DAH budget documents outlined in eTable 2 and 4.

Box 5. EXAMPLE. Australia’s DAH as a percentage of corresponding budget data

Australia provided global-health-specific budget data for 1998–2018 through its International Development Assistance and Overseas Aid Program budgets. For 1998–2017, health ODA and observed DAH were used to create DAH to budget ratios. These budget ratios were then applied to 2018 health ODA budget data to project DAH in 2018, using a weighted average:

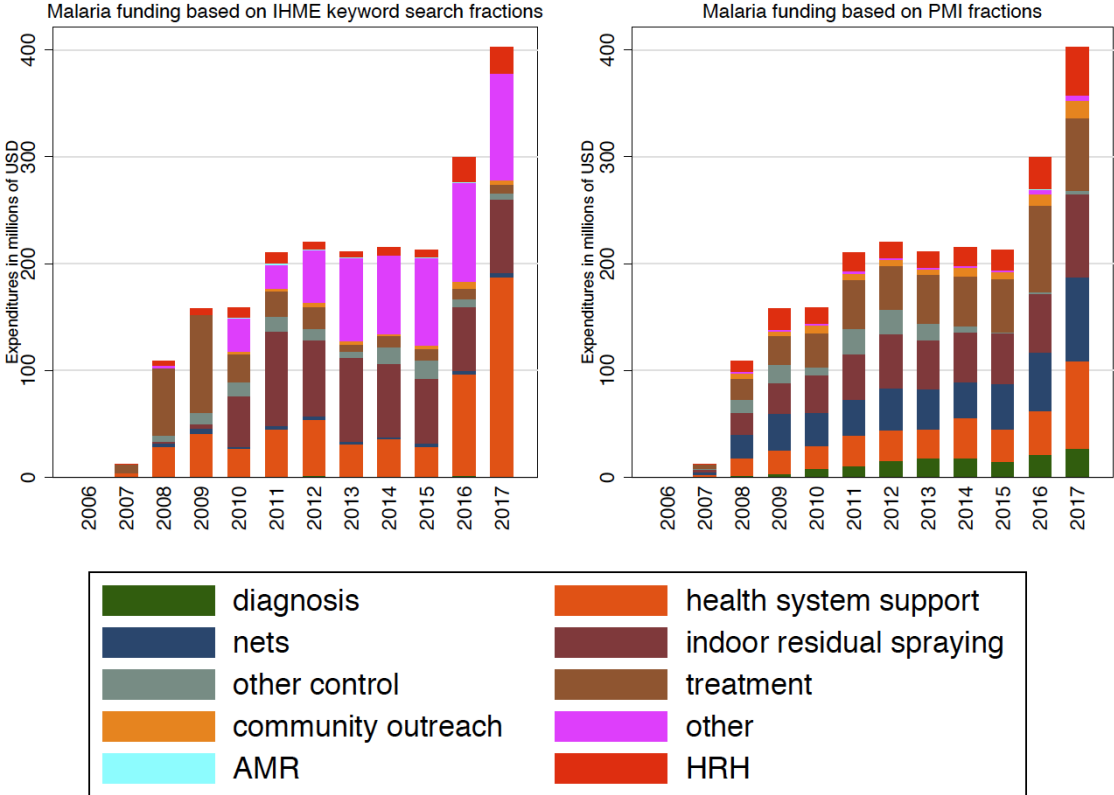

$$(Total\ DAH_t) = \left(\frac{1}{2}\right) (Budget\ ratio_{t-1}) (Budgeted\ GHE_t) + \left(\frac{1}{3}\right) (Budget\ ratio_{t-2}) (Budgeted\ GHE_t) + \left(\frac{1}{6}\right) (Budget\ ratio_{t-3}) (Budgeted\ GHE_t)$$

where t = year to be modeled.

To supplement our estimates of development assistance for health to HIV/AIDS and malaria program areas for the United States, we used additional available data from the President’s Emergency Plan for AIDS Relief (PEPFAR)

and the President’s Malaria Initiative (PMI). We downloaded data on all planned funding by PEPFAR by recipient country, year, and program area from 2004 to 2017.⁷⁵ All PEPFAR projects were assigned to our eight HIV/AIDS program areas using PEPFAR budget codes, splitting out overhead costs equally to all other program areas. We then created country-year-specific HIV/AIDS program area fractions out of total annual HIV/AIDS DAH, which we applied to all United States HIV/AIDS projects in the CRS from 2004 to 2017 by country-year. To inform malaria funding by program areas, we downloaded the most recently available malaria funding tables from malaria operational plans for all countries and years.⁷⁶ We used a keyword search to assign each line item in these tables to our eight malaria program areas, and then created fractions for the malaria program areas out of the total annual malaria DAH specific to each country-year. These fractions were applied to all United States malaria projects in the CRS from 2006 to 2017 by country-year.

eFigure 5. Malaria DAH to program areas as assigned by keyword search and PMI reports

Source: IHME DAH Database (2018) and PMI malaria operational plans

This figure outlines the assignment of funding to malaria program areas for United States projects from the OECD CRS from 2006 onward. The figure on the left shows how malaria funding is broken out based on keyword search. The figure on the right shows the breakdown of funding to malaria program areas based on PMI malaria funding tables. Using the data from PMI reduces the amount of funding allocated to the “other” program area. As such, in as often as more disaggregated information on project allocation is available, IHME uses such project information available in project budget documents or other project documents to disaggregate into program areas.

Tracking development assistance for health from the development banks

The World Bank project-level health disbursement data for 1990 through August 2018 were obtained through correspondence with Kathleen E. Krackenberg, Operations Analyst.⁷⁷ The World Bank recently underwent a recoding process for their disbursements. This recoding affected health disbursements; however, the recoding was not completed for projects with disbursements prior to 2001. To create a comparable dataset, adjustments had to be made. Regression analysis to predict health disbursements were explored; however, in the end, the average percentage change between project-level health disbursements before and after recoding was used to adjust health disbursements prior to 2001. It was observed that on average, between 2001 and 2005 (inclusive) the recoding process decreased health disbursements by 0.22%. This number was used to adjust all project-level health disbursements prior to 2001.⁷⁸ Health disbursements included all health projects as well as other sector projects with a health sector code. In addition, data were collected from the World Bank online loans database in order to fill in descriptive information for loans from the two arms of the World Bank: the International Development Association (IDA) and the International Bank for Reconstruction and Development (IBRD).⁷⁹ Along with keyword searches, health theme codes were used to allocate disbursements by health focus area. The online database contains up to five sector codes and five theme codes that can be assigned to each project. Sector codes represent economic, political, and social subdivisions, while theme codes represent the goals or objectives of World Bank activities. The codes are summarized in eTable 7. Emergency recovery loans were excluded since they do not fit the definition of DAH.

eTable 7. World Bank’s health sector and theme codes

Health sector codes Sector codes represent economic, political, or social subdivisions within society. World Bank projects are classified by up to five sectors.	Health theme codes Theme codes represent the goals or objectives of World Bank activities.
Historical (prior to 2001): (1) Basic health (2) Other population health and nutrition (3) Targeted health (4) Primary health, including reproductive health, child health, and health promotion Current (as of 2001): (1) Health (2) Compulsory health finance (3) Public administration – health (4) Noncompulsory health finance	Current: (1) HIV/AIDS (2) Malaria (3) Tuberculosis (4) Other communicable diseases (5) Population and reproductive health (6) Child health (7) Nutrition and food security (8) Injuries and non-communicable diseases (9) Health system performance (10) Social analysis and monitoring

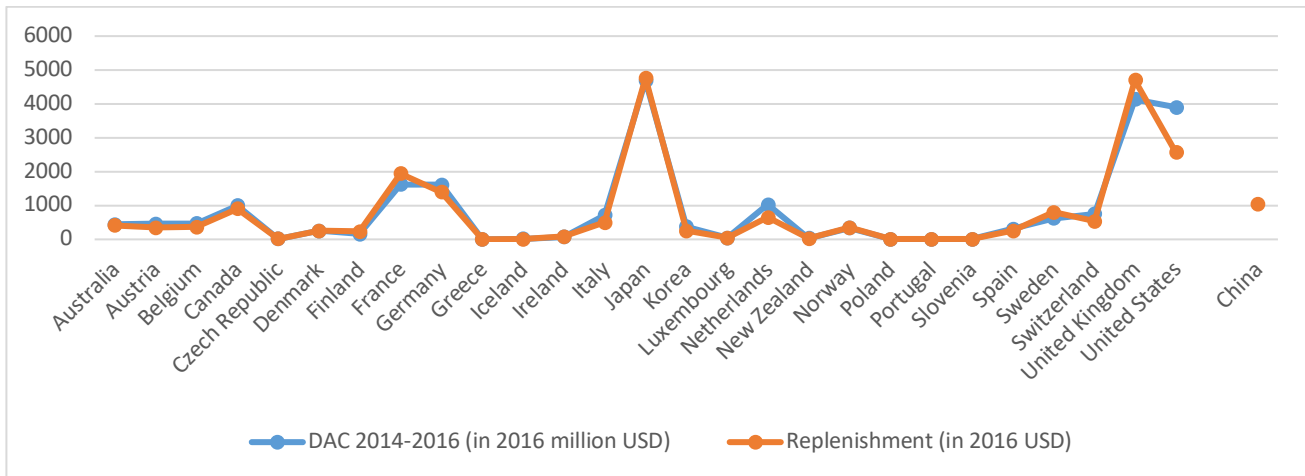

Data on yearly government contributions were obtained from the DAC statistics in order to disaggregate IDA flows by source. Because China does not report to DAC, we generated contribution estimates using replenishment data. We split the three-year replenishment amount over the three years of the 16th-19th replenishment, to obtain China’s contributions to the World Bank from 2008 to 2017. We validated our use of replenishment data by extracting China’s and other countries’ contributions to the World Bank International Development Association (IDA) 16th, 17th, and 18th replenishments and comparing the number with the contribution we extracted from the OECD Creditor Reporting System (CRS)⁸⁰. The trend of contribution from major donors was similar, and we therefore used China’s replenishment contribution as a proxy of the contribution to World Bank IDA. We further disaggregated the DAH contribution to World Bank IDA from China by multiplying China’s contributing proportion over World Bank IDA’s total health envelope.

Panel a. Comparison of World Bank International Development Association 16th Replenishment

Panel b. Comparison of World Bank International Development Association 17th Replenishment

Panel c. Comparison of World Bank International Development Association 18th Replenishment

eFigure 6. Comparison of World Bank IDA Replenishment and DAC

The three figures show the comparison of country commitment to World Bank IDA replenishment rounds and yearly government contributions reported to DAC statistics. The orange line shows the country commitment to each IDA replenishment round. The blue line shows the sum of yearly reported contributions during the three-year replenishment round. Panel a is contributions and commitments from replenishment round 16; panel b is contributions and commitments from replenishment round 17; panel c is contributions and commitments from replenishment round 18.

Details on how we estimated the cost of providing technical assistance and program support for these institutions are highlighted below in the section titled “Calculating the technical assistance and program support component of development assistance for health from loan- and grant-making channels of assistance.” The data received from the World Bank captured disbursements for January 1 to August 15, 2018, so the 2018 total estimates for IDA and IBRD were rescaled to 12 months.

Regional development banks

The Asian Development Bank (ADB) and Inter-American Development Bank (IDB) maintain their own loan databases, which were used to estimate disbursements.^{15,16,81} To estimate health disbursements from the African Development Bank (AfDB), data were received via correspondence with Ms. Josselyne Ahogny (Manager, Loan accounting division).³⁵ To estimate health disbursement from the Asian Development Bank (ADB), data were received via correspondence with Dr. Rouselle F. Lavado. eTable 8 provides a summary of the data sources used across the regional banks. Furthermore, eFigure 6 displays the disbursements for AfDB from 1990 to 2018 and eFigures 7 and 8 display commitments and disbursements from 1990 to 2018 for ADB and IDB.

For AfDB, we received project-level disbursement data from 2001 through December 2018. Data from the Compendium of Statistics were used for estimates pre-2001. Donor information for projects funded by the African Development Fund was based on subscription information from the ninth to 14th replenishment reports.⁸² The sole donor to projects implemented by the Nigeria Trust Fund was Nigeria, and all income for African Development Bank projects was attributable to other sources.

For ADB, we received project-level disbursement data from 1990 through 2018, including recipient, project title and description, and annual disbursement. Keyword search was performed to identify health focus area of the projects. For income source of ADB, data for country donations were extracted from the replenishment reports of Asian Development Fund, and we manually divided the three or four years’ replenishment into annual contributions.⁸³ We extracted the total revenue of Ordinary Capital Resources and Asian Development Fund from the Financial reports of ADB to generate the total envelope of income sources, and subtracted the country contribution to provide the estimate for resources coming from the bank itself. Using the fraction for the Bank’s own resources and country contribution, we provided the estimate of income source for each project. For 2018, where we do not yet have the total envelope, the 2017 fraction for income source was used as a preliminary estimate for 2018.

The IDB’s project database also provided commitments and disbursements for all projects. The same methods were used for estimating annual disbursements from the IDB as were used for the ADB. Through correspondence, 2018 health loan disbursements were obtained. These numbers were used in the 2018 estimates. The dataset used to estimate disbursements for IDB was updated in September 2018. However, since these channels have so few new projects each year, it was assumed that smoothing disbursements over time for reported projects captured the majority of total disbursements for 2018. The contribution quotas by donor for the Fund for Special Operations from 1990 to 2016 were extracted from Annual Financial reports for the IDB. The ratio of each donor’s contribution to total contribution was applied to total disbursements to assign income sources. In 2017, the Fund for Special Operations was transferred to the Ordinary Capital. Donor assignments for 2017 onward are unallocable.

eTable 8. Summary of data sources for the regional development banks

This figure indicates the data available and used to estimate DAH. (X) indicates that project-level data are present in the dataset. (-) indicates that project-level data are not present in the dataset.

Institution	Data source	Commitments	Cumulative disbursements	Yearly disbursement	Notes
African Development Bank (AfDB)	Compendium of Statistics	X		(Aggregate – not at the project level)	The Compendium of Statistics was not available for 1990–1993, 1995, and 1998–1999; we estimated yearly disbursements using the average of neighboring disbursements
	Correspondence			X	Annual loan disbursements from 2001 through December 2018 were provided.
Asian Development Bank	Correspondence	X	X	X	Annual grant loan disbursements from 1990 through 2018 were provided.
Inter-American Development Bank	Online projects database		X		As yearly disbursement amounts are not provided in the online database, we estimated yearly disbursements by allocating cumulative disbursements over each year of the project.
	Correspondence			X	Loan disbursements from January modelled December 2018 were provided.

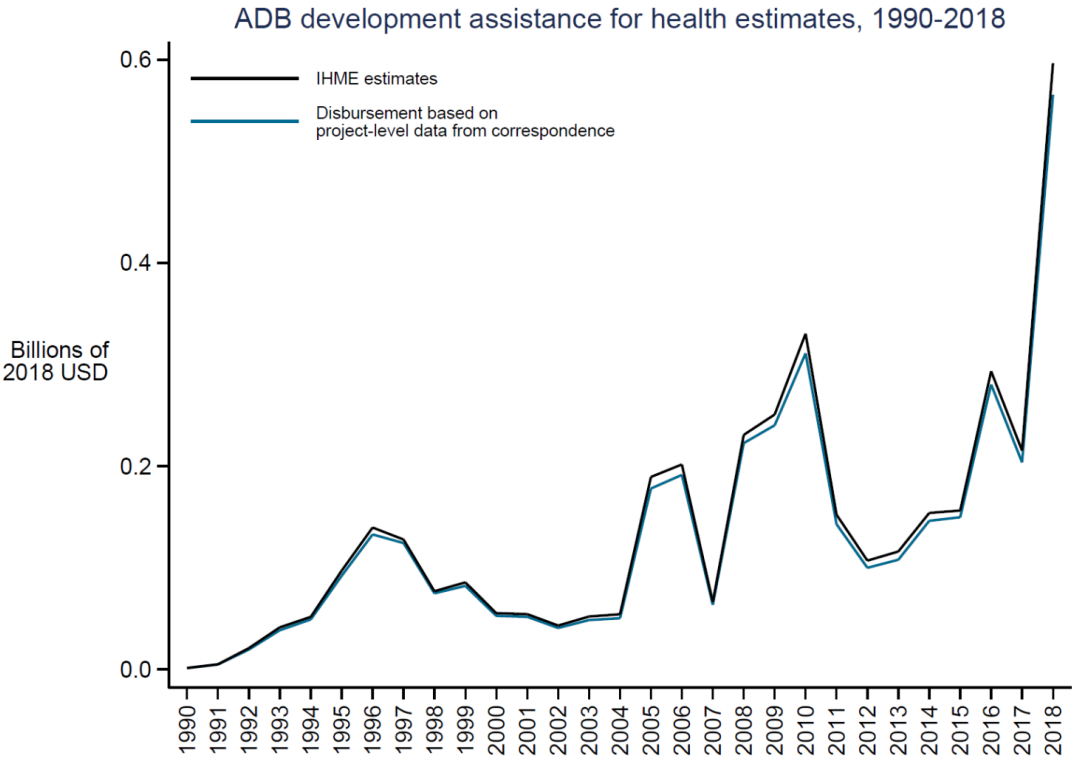

eFigure 7. Disbursements by the African Development Bank

The orange line with triangles shows estimated disbursements based on the Compendium of Statistics from 1990 through 2001 and actual disbursements received from 2001 onward.

Tracking contributions from the Global Fund and Gavi

The Global Fund

The grants database made available online by the Global Fund provides grant-level commitments and annual disbursements from its inception in 2002 to the present year.²² In addition, sources of funding were compiled from the Global Fund contributions dataset and annual reports, all downloaded from the Global Fund website.^{23,24} Regional grants were split evenly between all countries identified in the regional grant documents found on the Global Fund website. eFigure 10 shows the Global Fund’s annual contributions received from public and private sources. eFigure 10 shows the Global Fund’s annual commitments and disbursements from its project database from 2002 through 2018.

eFigure 11. The Global Fund’s commitments and disbursements

The dashed green line shows commitments from the Global Fund’s online grants database. The orange line shows disbursements from the online grants database.

Source: IHME DAH Database (2018)

Gavi, the Vaccine Alliance

Gavi provided publicly available project-level data on commitments, disbursements, and investment cases from 2000 through the present.^{18,21} Gavi’s annual DAH was defined as the sum of (1) project-level disbursements by year paid; (2) investment cases (one-time investments in disease prevention and control); and (3) administrative and work plan costs. Data from Gavi’s online databases include expenditure for (1) and (2), but not (3). However, project-level data from the CRS for 2007–2012 did include administrative and work plan costs, so disbursements data from the online database were adjusted to match the CRS in those years. The average fraction of administrative and work plan costs was added to total disbursements in 2000–2006 and 2013–2015, the years in which the CRS did not include these data. Contributions data from Gavi’s website as well as annual reports from the International Finance Facility for Immunisation (IFFIm) and Advance Market Commitment for Pneumococcal Vaccines were used to determine Gavi’s annual income.^{19,20,84}

All of the data sources used for Gavi estimates were complete through 2017. Donor contributions received and outstanding pledges data were available on Gavi’s website. The unadjusted total pledges were used as total disbursements for 2018. Gavi disbursements were assigned to health focus areas including child and newborn vaccines, HSS, and non-communicable diseases as documented in eTable 6 above. Of note, we reclassified all Gavi health systems strengthening projects as maternal, newborn, child health-specific health systems strengthening disbursements.

eFigure 12. Gavi’s income and disbursements

The dashed green line shows commitments from Gavi’s online database. The dashed orange line shows the disbursements from Gavi’s online database, which are the sum of project-level disbursements and investment cases. These data are adjusted using Gavi expenditure data reported to the Creditor Reporting System (CRS) to add administrative and work plan costs to the total. Adjusted disbursements are shown by the solid orange line.

Source: IHME DAH Database (2018)

Coalition for Epidemic Preparedness and Innovation

CEPI provided a complete dataset of all disbursed funding by disease and all income received from donors in 2018, the first year of CEPI disbursements. Funding data were provided per target vaccine, and all were classified under the other infectious diseases health focus area. Since CEPI donor data span from 2017 to 2018, the proportions by donor across these two years was applied to total disbursements in 2018.

Tracking expenditure by United Nations agencies active in the health domain

Data on income and expenditures were collected for six UN agencies: WHO, UNICEF, UNFPA, UNAIDS, Unitaid, and PAHO. The data sources and calculations for each are described in detail below. Similar to the bilateral channels, we extracted budget data for the UN agencies to predict DAH for years for which we did not have health expenditure data. Model choices and budget measures for UN agencies are presented in eTable 4.

World Health Organization

Data on WHO's budgetary and extrabudgetary income and expenditure were compiled from annual reports and audited financial statements released by WHO.⁸⁵ Income data were extracted from WHO's assessed and voluntary contributions, while expenditure data were extracted from both budgetary and extrabudgetary spending reports. For financial statements representing activities over a two-year period, both income and expenditure data were divided by two, in order to approximate yearly amounts, and dollars were deflated using the US GDP deflator specific to the reporting year. Expenditures from trust funds, regional offices tracked separately, and associated entities not part of WHO's program of activities, such as UNAIDS and Global Fund trust funds were excluded. Expenditures from supply services funds were also excluded, as these expenditures pertain to services provided by WHO but paid for by recipient countries. Additionally, WHO projects tracked as paid Ebola expenditure were extracted from the UNOCHA Financial Tracking System database and included as WHO health expenditure.

Disbursement data were not available for WHO in 2018. Much like the bilateral agencies, the ratio of DAH to the total program budget was estimated for 1990–2017 and then predicted for 2018 using the single-year average of previous year. The predicted ratio was then multiplied by the observed program budget for 2018 to get the estimates of DAH.

United Nations Population Fund

Data on income and expenditure were extracted for UNFPA from its audited financial statements.⁷² As the 1990–2005 statements represent activities over two-year periods, income and expenditure data were divided by two in order to approximate yearly amounts.

Income and expenditures associated with procurement and cost-sharing activities were excluded from estimates of health assistance because UNFPA uses cost-sharing accounts when a donor contributes to UNFPA for a project to be conducted in the donor's own country. Since this money can be considered domestic spending that goes through UNFPA before being returned to the country in the form of a UNFPA program, it is not included in calculations of total DAH. UNFPA's additional expenditures for these projects come from trust funds or regular resources and are therefore captured in our estimates. To estimate disbursements by health focus areas, UNFPA's total health expenditure was multiplied by the proportion of funding reported for each program area from annual reports from 1997 through 2013 and from the UNFPA transparency portal for 2014 through 2017. Maternal and child health spending classified as "other" was split equally between the maternal and child health program areas. Additionally, UNFPA projects tracked as paid Ebola expenditure were extracted from the UNOCHA Financial Tracking System database and added to UNFPA health expenditure.

The disbursement data for UNFPA were available through 2017. For year 2018, much like the bilateral agencies, the ratio of DAH and income was estimated for 1990–2017 and then predicted for 2018 using the three-year weighted average of previous years. The predicted ratio was multiplied by observed income to estimate DAH for 2018.

United Nations Children's Fund

Data on income and expenditure for UNICEF were extracted from its audited financial statements.⁶⁹ As these statements represent activities over two-year periods from 1990 to 2011, income and expenditure data were divided by two in order to approximate yearly amounts. The audited financial statements from 2012 onward are produced on an annual basis.

Since UNICEF's activities are not limited to the health sector, the fraction of UNICEF's expenditure that was for health was estimated using either financial data from correspondence (2001–2013 observed data used to estimate 1990 through 2000 expenditure) or a combination of annual reports and annual results reports from 2014 through 2017. The annual results reports provide the proportion of funding for each program area, and the average of 2014 through 2017 proportions was used to estimate the spending proportion for the years 1990 through 2013. In the

annual results report, HIV/AIDS funding was reported separately from health funding, so the percentages spent on each health program were proportioned based on total spending for health. Furthermore, UNICEF projects tracked as paid Ebola expenditure were extracted from the UNOCHA Financial Tracking System and added to estimates for UNICEF's health expenditure.

The product of observed program budget and the weighted average of the DAH to budget ratio (placing one-half weight on the one-year lagged ratio, one-third weight on the two-year lagged ratio, and one-sixth weight on the three-year lagged ratio) was used to predict DAH in 2018.

Joint United Nations Programme on HIV/AIDS

UNAIDS income and expenditure data for both its core and noncore budgets were extracted from its audited financial statements.⁶⁷ As financial data are provided on a biennial basis in all years except for 2012 and 2013, the values were divided by two to obtain yearly amounts for all biennium data. Dollars were deflated using the US GDP deflator specific to the reporting year.

For UNAIDS, budget measures were available only for a subset of reported total disbursements. UNAIDS reported total expenditure, which combined Unified Budget and Workplan (UBW) and non-UBW components, but only UBW budget data were available.⁶⁸ To predict DAH for UNAIDS in 2018, disbursements in those years were calculated by multiplying the observed UBW budget by the three-year weighted average of the ratio of DAH to the UBW budget (placing one-half weight on the one-year lagged ratio, one-third weight on the two-year lagged ratio, and one-sixth weight on the three-year lagged ratio). UNAIDS disbursements were assigned to HIV/AIDS and TB program areas as documented in eTable 6 above.

Unitaid

Data on project level disbursement was obtain through correspondence with Unitaid. Income data were extracted from the annual financial statements downloaded from Unitaid's website. The project-level data provided covered project disbursements from 2007 through 2017, and project budget commitments were provided for 2018.

Pan American Health Organization

The Pan American Regional Office for WHO, or PAHO, reports its income and expenditure in its biennial financial report.^{10,86} The funds transferred through the "Rotating Fund" were excluded because developing countries fund this procurement of health commodities which are then used within that funding country, and it therefore does not fit the definition of DAH.

As the financial data are provided on a biennial basis (with the exception of 2010 through 2016, where single-year financial reports were available), the quantities were divided by two to obtain yearly amounts. Dollars were deflated using the US GDP deflator specific to the reporting year.

Correspondence with PAHO revealed that data from the financial statements include both Program and non-Program funds. The latter include funds that countries provide PAHO, so that PAHO can reinvest these funds into the countries' national health systems. These funds should not be included as development assistance for health, and PAHO provided corrected disbursement numbers for 2008 to 2013. The corresponding disbursement numbers for 2014 and 2015 were identified in the PAHO End-of-Biennium Assessment 2014–2015. These funds were provided as biennial disbursements, so they were divided by two to obtain yearly disbursements. The ratio of Program disbursements numbers provided by PAHO and the sum of Program and non-Program funds collected from financial statements was taken for the years 2008 to 2015. The average ratio was calculated, and this ratio was multiplied through disbursement numbers collected from financial statements from earlier years. In this way, Program and non-Program funds collected from audited statements from earlier years were adjusted to estimate DAH.

For PAHO, disbursement data were not available for 2018. PAHO provided budget information along with disbursements for 2008 to 2017. The average ratio between spending and budget was calculated over the years 2008 to 2017, and this ratio was used to estimate 2018 disbursements.

Tracking development assistance for health from private foundations

Previous studies on foundations outside the US have documented the severe paucity of reliable time series data and lack of comparability across countries.⁸⁷ Hence, this research focused efforts on tracking only US foundations.

US Foundations

The Foundation Center maintains a database of all grants of \$10,000 or more awarded by over 1,000 US foundations. The Foundation Center has coded each grant by sector and international focus and therefore is able to identify global health grants. IHME purchased a customized dataset with cross-border health grants and health grants to US-based international programs from 1992 to 2015 from the Foundation Center.³² Grants from the Gates Foundation, which were tracked separately, were excluded. Additionally, grants to channels that this research already tracks were excluded.

The Foundation Center adopted a new classification methodology as of FGH 2016. The Foundation Center was able to provide historical data based on the new classification system from 2002 to 2012. In order to obtain the series from 1990 to 2001, we multiplied a weighted fraction calculated based on both old and new classification data values from 2002 through 2004 by the old data series (1992–2001) we had previously obtained.

$$\begin{aligned}
 & \text{(Weighted fraction)} \\
 &= \left(\frac{1}{2}\right) (DAH_{new\ classification}) / (DAH_{old\ classification})_{2002} \\
 &+ \left(\frac{1}{3}\right) (DAH_{new\ classification}) / (DAH_{old\ classification})_{2003} \\
 &+ \left(\frac{1}{6}\right) (DAH_{new\ classification}) / (DAH_{old\ classification})_{2004}
 \end{aligned}$$

$$(DAH\ Estimate_t) = (Weighted\ fraction)(DAH\ Observed_t)$$

where DAH Observed is the old data values for the series 1990 through 2001

To estimate total health grants in 1990–1991 and 2016–2018, the natural log of US foundation DAH was regressed on the lagged natural log of US GDP per capita and year using ordinary least squares estimation. The missing years of data were predicted based on estimated regression coefficients from the equation. Exponents of the predicted values were used as final estimates

$$(\ln\ Foundation_t) = \alpha + 1. \beta_1(\ln\ US\ GDP\ per\ capita_t) + \beta_2(year_t) + \varepsilon$$

Details on how we estimated the cost of providing technical assistance and program support for these US foundations are highlighted below in the section titled “Calculating the technical assistance and program support component of development assistance for health from loan- and grant-making channels of assistance.”

Bill & Melinda Gates Foundation

The Gates Foundation has been the single largest grant-making institution in the health domain since 2000; hence, additional research was undertaken to accurately capture its annual disbursements. The Gates Foundation’s IRS

990PF filings for years 1999–2008, which report all global health grants disbursed per year, were downloaded from the Foundation’s website. Additionally, disbursement data for years 2009–2017 were collected from the Gates Foundation online grants database, the OECD CRS, and personal correspondence. The OECD CRS data were used to identify NGOs that are double-counted from other data sources.

An ordinary least squares linear regression model was used to predict the disbursement for the Gates Foundation for 2018. Since there is a strong correlation between market trends and Gates Foundation annual disbursements, market data including lagged US GDP, lagged yearly average of Berkshire stock returns, lagged yearly average of the Russell Index, and lagged total assets of the Gates Foundation Trust were utilized to predict the total disbursement for year 2018.

$$\begin{aligned}
 & (\text{BMGF total disbursement}_t) \\
 & = \alpha + \beta_1(\text{US GDP per capita}_{t-2}) + \beta_2(\text{Berkshire stock returns}_{t-2}) \\
 & + \beta_3(\text{Russell Index}_{t-2}) + \beta_4(\text{BMGF total asset}_{t-2}) + \varepsilon
 \end{aligned}$$

The Foundation’s predicted DAH was adjusted to account for in-kind DAH and double-counting. The difference between its final DAH and DAH without in-kind added and double-counting removed from 2003–2017 was regressed using ordinary least squares on DAH without in-kind added and double-counting removed and year. The predicted difference was then subtracted from the predicted DAH from the previous regression for 2018.

The Wellcome Trust

We obtained a complete database of all grants awarded by the trust since 1990 through correspondence. While the primary focus of Wellcome Trust grants is health care, the Trust provided a variable that distinguishes grant work intended for low- and lower-middle-income countries from research primarily focused in high-income recipient countries. Wellcome Trust DAH is defined as this subset of low- and lower-middle-income focused grants. The annual disbursement amount was obtained by redistributing the lump sum value of the grant over the stipulated duration of the grant by calculating the number of days per year in which the grant was active and multiplying by the average amount disbursed in each day the grant was active. All data were provided in nominal GBP and were converted to real 2018 USD.

European Economic Area

DAH estimates for the European Economic Area were based on two downloadable project datasets available online. IHME DAH data for 2014 to 2018 were obtained from projects in the 2009–2014 grant period dataset with program area “public health initiatives”, and 2007–2012 data were obtained from projects in the 2004–2009 grant period dataset with sector “health and childcare.” Childcare projects not related to health were identified and excluded based on manual screening and keyword search for the following terms: "NURSERY" "ORPHANAGE" "RECREATION" "FOSTER" " CARE HOME " " CHILDREN S HOME " " CHILD DEVELOPMENT CENTRE " " YOUTH CENTER" " YOUTH CAMPS " " RESIDENTIAL CENTRE" " RESIDENTIAL CARE FACILITIES " "CHILDCARE" " INFORMAL EDUCATION FOR CHILDREN " " PREVENT INSTITUTIONALISATION " " SPORTS FIELD" " SPORT FIELD" " SPORTS FACILIT" " SPORTS ACTIVIT" " SPORTS INFRASTRUCTURE" " REINTEGRATION OF JUVENILE OFFENDERS "

We determined that no health projects to low- and middle-income countries were implemented by the EEA prior to the 2004–2009 grant period, based on the report on the Financial Instrument 1999–2003 and the Financial Mechanism 1994–1998.^{88,89} Project summary variables were obtained through correspondence and were used together with project titles to assign DAH to health focus areas using a keyword search. To assign annual funding for projects that were implemented across multiple years, project grants were split based on the average daily

spending across the duration of the project and the proportion of the year that the project was in implementation. The relative contributions of donors to the EEA grants (Norway, Iceland, and Liechtenstein) were obtained as constant ratios based on the 2016–2017 Annual Report.⁹⁰

Tracking non-governmental organizations

Currently, there are no centralized, easily accessible databases for tracking program expenses of the thousands of NGOs based in high-income countries that are active in providing development assistance and humanitarian relief worldwide. This study relied on CRS data and the only comprehensive data source identified for a large subset of these NGOs, namely the United States Agency for International Development’s Report of Voluntary Agencies (USAID’s VolAg report).²⁷ The report, which includes both US-based and international NGOs that received funding from the US government, provides data from 1990 to 2014 on domestic and overseas expenditures for these NGOs as well as their revenue from US and other public sources, private contributions, and in-kind. Total revenue and expenditure data obtained from the NGOs’ IRS tax forms, accessed through the GuideStar online database, were also used in tracking NGOs incorporated in the US.²⁶ The Guidestar Research Fundamentals Plus dataset was used to obtain information for US-based NGOs in fiscal year 2015, including domestic, overseas, and total expenses, and revenues from all public and private sources.

First, in order to track disbursements from OECD donor countries to NGOs, we utilized channel codes present in the CRS database. The code 21000 identified international NGOs, and the code 22000 identified donor-country-based NGOs. In order to remove double-counting, we conducted a keyword search on channels where the donor country was the United States to exclude NGOs present in the USAID VolAg report. Allocation of funding to health focus areas for NGOs tracked through the CRS was assigned as described in the section “DISAGGREGATING BY HEALTH FOCUS AREA,” based on a keyword search of five descriptive variables in the CRS: project title, short description, long description, channel name, and channel reported name. For NGOs tracked in the USAID VolAg report, allocation of funding to health focus areas was assigned as described in the section “DISAGGREGATING BY HEALTH FOCUS AREA,” based on a keyword search of the NGO’s description given in the VolAg report.

In order to use the USAID VolAg data, several challenges were overcome. We outline these challenges here and discuss below the methods employed to estimate a consistent series of DAH channeled through NGOs despite these challenges. First, with the exception of the Gates Foundation, it was impossible to track the amount of funding from US foundations routed through US NGOs, which may have led to double-counting in estimates of total health assistance. The second challenge relates to the incompleteness of the universe of NGOs captured through the USAID report. The report provides data on NGOs that received funding from the US government. While this covers many of the largest NGOs, it is not a comprehensive list. A related problem is that the VolAg report only includes NGOs that received funds in a given year. While many of the largest NGOs are consistently funded by the US government and are therefore in the report every year, not all NGOs are reported across all years. Third, health-sector-specific expenditure is not reported in the VolAg or systematically reported in IRS tax forms. The VolAg does report overseas expenditure but does not disaggregate this expenditure by sector. Fourth, complete data are lacking in several time periods. The 2016 VolAg provided data through 2014. For NGOs incorporated in the US, IRS tax forms were obtained. Furthermore, prior to 1998, the VolAg report did not include international NGOs. Attempts were made to compile other data on the health expenditures of the top international NGOs, in terms of overseas expenditure, by searching other websites for financial documents and contacting these organizations directly. Getting reliable time series data before 2000 proved to be extremely difficult for even this small sample of international NGOs.

Estimates of the share of overseas expenditure spent on health-related projects drew upon a sample of NGOs for which such data were available. Collecting financial data on health expenditures for each NGO would have been prohibitively time-consuming. Therefore, a sample of NGOs was drawn from the list for each year; the sample included the top 30 NGOs in terms of overseas expenditure and 20 randomly selected US-based NGOs from the remaining pool, with the probability of being selected set proportional to overseas expenditure. Next, health

expenditure data were collected for each NGO in this sample by seeking out annual reports, audited financial statements, 990 tax forms, and data from NGO websites. Health expenditure was carefully reviewed to ensure that expenditures on food aid, food security, disaster relief, and water and sanitation projects were not included. eTable 9 summarizes the number of NGOs included each year in the USAID report, the number of NGOs in the sample by year, and the number of NGOs for which health expenditure data were successfully compiled.

eTable 9. Summary of US non-governmental organizations in the study

Year	Number of US NGOs in VolAG report	Number of international NGOs in VolAG report	Number of US NGOs in IHME sample	Number of US NGOs from sample for which data on health expenditure were found
1990	267	-	16	9
1991	334	-	19	14
1992	385	-	18	15
1993	411	-	17	12
1994	424	-	17	10
1995	416	-	16	12
1996	423	-	21	14
1997	425	-	23	18
1998	435	42	24	22
1999	438	-	33	28
2000	433	50	34	28
2001	442	51	33	26
2002	486	58	33	27
2003	507	54	42	32
2004	508	55	47	33
2005	494	59	45	36
2006	536	67	50	38
2007	556	68	50	40
2008	565	78	58	48
2009	580	90	57	45
2010	579	94	69	57
2011	595	112	73	63
2012	579	94	69	60
2013	519	113	69	52
2014	485	106	73	54
2015	-	-	67	58

A random effects regression model was fit to predict health expenditure as a fraction of total expenditure using the data for the sampled NGOs. A random effects model was chosen because the sample included observations for several NGOs for multiple years. A random effects model allows for the effect of each type of NGO to be captured distinctly. This model was used to predict the fraction of expenditure spent on health for the remaining NGOs. To ensure that the predicted health fractions were bounded between zero and one, the regression utilized the logit-transformed health fraction as the dependent variable. Since several NGOs in the sample were observed for multiple years, the regression included a random effect that varied by NGO. Five of the nine variables used to predict the

health fraction were drawn from the VolAg reports and the Guidestar dataset. They were (1) fraction of revenue from in-kind donations, (2) fraction of revenue from the US government, (3) fraction of revenue from private financial contributions, (4) overseas expenditure as a fraction of total expenditure, and (5) calendar year. The remaining four variables used to predict the health fraction were binary indicators that were constructed based on keyword searches on the NGO name and NGO description found in the VolAg. For both the NGO name and description, a keyword search was conducted to indicate whether the name or description was sufficiently health-related. Another keyword search was conducted independently on the NGO names and descriptions for keywords that indicated if the NGOs might focus on something other than health. These four indicators proved excellent predictors of health fractions.

$$\begin{aligned}
 \text{logit}(\text{NGO} - \text{specific DAH}_{it}) & \\
 &= \alpha + \beta_1(\text{Inkind contributions fraction}_{it}) \\
 &+ \beta_2(\text{US government contributions fraction}_{it}) \\
 &+ \beta_3(\text{Private financial contributions fractions}_{it}) \\
 &+ \beta_4(\text{Overseas expenditure as a fraction of total expenditure}_{it}) \\
 &+ \beta_5(\text{Health} - \text{related name}_{it}) + \beta_6(\text{Non} - \text{health} - \text{related name}_{it}) \\
 &+ \beta_7(\text{Health} - \text{related description}_{it}) + \beta_8(\text{Non} - \text{health} - \text{related description}_{it}) + U_i + \varepsilon
 \end{aligned}$$

Overseas health expenditure was calculated for individual NGOs in each year by multiplying the estimated health fraction and total overseas expenditure. For the NGOs that were sampled, the observed health fraction acquired through data collection was used. For the unsampled NGOs, the fitted fraction from the previously described random effects regression was used. Total overseas expenditure, reported in the VolAg, was not available for 2015–2018. For US-based NGOs, the 2016 NGO overseas fraction was calculated by regressing the logit transformed observed overseas fraction on a linear time trend using ordinary least squares, for each NGO independently. For these cases, the overseas health fraction was calculated as the product of estimated overseas fraction, estimated health fraction, and total expenditure found in the IRS 990 forms.

$$\text{logit}(\text{Observed overseas health expenditure}_i) = \alpha + \beta_i(\text{year}_t) + U_i + \varepsilon$$

At this point three reasons remained why the overseas health expenditure for some NGOs remained unknown. First, if an observation was non-US-based, then IRS tax forms were not available and total overseas expenditure could not be calculated. Second, for 2017 to 2018, no data were available. Finally, if an NGO was reported in the VolAg in multiple years but not for an intermittent year, no NGO-specific data were available for the gap year. This would be the case if an NGO received support from the US government one year and then again in a nonconsecutive year. For all three of these scenarios, a panel-based hierarchical linear regression model was used to fill in the overseas health expenditure gaps. Total overseas health expenditure (measured at the NGO-year level) was regressed on US GDP per capita and US bilateral DAH disbursed. Because the US government funds many of these NGOs, US bilateral DAH was an excellent predictor of NGO DAH. A flexible model was employed to allow both the GDP and US government DAH coefficients to vary randomly across NGOs, such that each NGO employed a unique (but not independent) relationship between overseas health expenditure, GDP, and US government DAH. A random intercept was also included to capture the significant unobserved heterogeneity present in our set of NGOs. Once fit, this model was used to predict overseas health expenditure for all remaining gaps.

$$(\text{NGO DAH}_{it}) = \alpha + \beta_{1i}(\text{US GDP per capita}_t) + \beta_{2i}(\text{US bilateral DAH per capita}_t) + U_i + \varepsilon$$

Expenditures financed from each revenue source were then calculated by multiplying overseas health expenditure by NGO-specific revenue fractions. Expenditures from in-kind sources were deflated by a constant fraction. This was determined by comparing the federal upper limit and average wholesale price valuations of drugs on WHO's Model List of Essential Medicines from the RED BOOK Expanded Database.^{28,29} eFigure 13 and eFigure 14 show the

income and estimated overseas health expenditure, respectively, of the NGOs in the universe of US- and non-US-based NGOs that were tracked in this study from 1990 to 2015 in constant 2018 US dollars.

eFigure 13. Total revenue received by non-governmental organizations

The orange line shows total revenue for all sources, both public and private, received by NGOs. The green line shows estimates of private financial contributions to NGOs, while the blue line shows private in-kind donations to NGOs.

Calculating the technical assistance and program support component of development assistance for health from loan- and grant-making channels of assistance

The following methods were used to estimate the costs incurred by loan- and grant-making institutions for administering and supporting health sector loans and grants, which includes costs related to staffing and program management.

Data on the total administrative costs were compiled for institutions in our universe for which these data were readily available: IDA, IBRD, ADB, AfDB, IDB, the Gates Foundation, the Wellcome Trust, US Foundations, CEPI, the Global Fund, Gavi, UNICEF, UNFPA, WHO, UNITAID, PAHO, UNAIDS, USAID, the UK Department for International Development (DFID), Japan International Cooperation Agency (JICA), Norwegian Aid Agency (NORAD), and the Swedish International Development Agency (SIDA). The sources of data for the institutions in this sample are summarized in eTable 10. The ratio of total administrative costs to total grants and loans was calculated for each source by year. It was assumed that the percentage of operating and administrative costs devoted to health would be equal to the percentage of grants and loans that were for health. In other words, if 20% of a foundation’s grants were for health, the model assumed that 20% of administrative costs of the foundation were spent on facilitating these health grants. Given this assumption, the ratios of the observed administrative costs to

grants/loans were used to estimate the in-kind contribution made by each of these organizations toward maintaining their health grants and loans. For the institutions not in this sample, the ratio from the institution most similar to it was used to arrive at an estimate of in-kind contributions. For example, for US foundations we selected the top 10 and bottom 10 US foundations based on total disbursements across the entire time period. For each foundation, we calculated the ratio of the “cash basis” column of total operating and administrative expenses to grants paid. We then used the average of these top 10 and bottom 10 foundations ratio as the in-kind ratio across time. Total in-kind contributions from all grant- and loan-making global health institutions are shown in eFigure 14.

eTable 10. Summary of data sources for calculating in-kind contributions

Organization	Source	Notes
Gates Foundation	990 tax returns (1999–2006) Gates Foundation Trust financial statements (2007–2017)	Used “cash basis” column to calculate ratio of total operating and administrative expenses to grants paid. Used “grants expenditure” statement to calculate ratio of administrative expenditure to grants/program expenditure.
US foundations	990 tax returns	Calculated the average across time of the ratio of the “cash basis” column of total operating and administrative expenses to grants paid.
Wellcome Trust	Annual report	Calculated ratio of support costs to grants awarded by the trust
CEPI	Board of directors’ report, 2016–2017	Calculated ratio of operating expenses to total expenditure.
Global Fund	Annual report financial statements	Calculated ratio of operating expenses to grants disbursed.
Gavi	Annual report financial statements	Calculated ratio of management, general, and fundraising expenses to program expenses.
UNICEF	Annual report financial statements	Calculated ratio of program support to total expenditure (1990–2011) Calculated ratio of institutional budget to total program and emergency budgets (2012–2017).
UNFPA	Annual financial review	Calculated ratio of institutional budget to total expenses.
WHO	Financial report and annual financial statements	Calculated ratio of general operating expenses to total expenses.
Unitaid	Financial statement	Calculated ratio of operating expenses to program expenses.
USAID	US government budget database	Used outlays spreadsheet to calculate ratio of total outlays for USAID operating account to sum of outlays for bilateral accounts.
DFID	Annual report expense summary	Calculated ratio of DFID’s administration expenses to DFID’s bilateral program expenses from 2002 onward.

JICA	Statement of income in annual report	Calculated ratio of general administrative expenses to operating expenses less depreciation.
SIDA and other Swedish agencies disbursing aid	Swedish OpenAid website ⁹¹	Calculated ratio of administrative costs to the sum of all program expenses.
NORAD and other Norwegian agencies disbursing aid	Norwegian Aid statistics website ⁹²	Calculated ratio of general administrative expenses to operating expenses less depreciation.
IDA	World Bank audited financial statements	Calculated ratio of management fee charged by IBRD to development credit disbursements.
IBRD	World Bank audited financial statements	Calculated ratio of administrative expenses to loan disbursements.
AfDB	Income statements in annual reports	Calculated ratio of administrative expenses to the sum of loan and grant disbursements.
ADB	Annual report	Calculated ratio of administrative expenses to the sum of loan and grant disbursements.
IDB	Annual report and financial statement	Calculated the ratio of administrative expenses to total loan disbursements.
EEA	Administrative budget data ⁹³	Calculated ratio of donor states' management budget and donor program partners' participation to net allocation to beneficiary countries.
PAHO	Audited financial statements	Calculated ratio of general operating expenses and contractual services to total expenses.
UNAIDS	Audited financial statements	Calculated ratio of general operating expenses to total expenses.

eFigure 15. In-kind contributions by loan- and grant-making DAH channels of assistance

This figure illustrates the proportions of financial and in-kind DAH disbursed by loan- and grant-making institutions. The proportion of in-kind DAH varies based on the channel. The overall proportion of in-kind DAH received across all channels has grown over time.

SECTION 3: Tracking development assistance for health from China, 1990–2018

Overview

The estimates of DAH contributions from China are based on data from diverse sources including government reports and international development agencies databases. We generate estimates for bilateral and multilateral contributions from China separately and aggregate to obtain the total DAH contributions from China. We use project descriptions and reports where available to determine health focus areas of the contributions. For years with limited data, we use various methods inclusive of interpolation and modeling to generate estimates. Research explaining these methods completely is currently under review.

SECTION 4: TRACKING TOTAL SPENDING ON MALARIA BY SOURCE IN 106 COUNTRIES, 2000–2016

1. Currency conversion

All malaria expenditure estimates were made and reported in 2018 United States dollars (USD). Data sources reported expenditure in either nominal local currency units (LCUs) or nominal USD. To convert nominal LCUs to USD, we applied deflators to nominal LCUs to inflate to 2018 LCUs. We then applied exchange rates to produce 2018 USD. When LCUs were not reported, we extracted reported expenditure in nominal USD, applied corresponding nominal exchange rates to produce nominal LCUs, inflated nominal LCUs to 2018 LCUs with deflators, and finally exchanged 2018 LCUs to 2018 USD. All deflators and exchange rates were extracted from the World Bank,¹ International Monetary Fund,² Penn World Tables,³ the United Nations National Accounts,⁴ and the World Health Organization,⁵ and were imputed to provide a complete series for each of the variables between 1950 and 2018. We then used several models including ordinary least-squares regression and mixed effects models, to complete each source series. More information about the approach to converters and deflators may be found in Global Burden of Disease Health Financing Collaborator Network (2019).⁶

2. Government health expenditure as a source on malaria

Data

Government spending on malaria was drawn from three main sources. First, we extracted data on government spending reported by National Malaria Control Programmes (NMCPs) to the World Health Organization (WHO) and published in the WHO's annual World Malaria Reports (WMRs).¹ We conducted a web search of all existing National Health Accounts, including those hosted by WHO on the Global Health Expenditure Database, and found 40 reports that estimated government expenditure as a source dedicated to malaria prevention, control, and treatment.² Finally, we extracted the government spending reported by governments submitting proposals and concept notes to the Global Fund. We excluded any projections for spending reported in these documents submitted to the Global Fund. Table 1 shows the number of country-years available for each data source.

Table S1. Main data sources for government health expenditure as a source for malaria

Data source	Country-years of data
NMCP reports in the WMRs	890
NHAs	86
Global Fund proposals and concept notes	381

The spending reported by NMCPs to the WMRs typically captures expenditure on prevention activities, such as insecticide-treated nets, indoor residual spraying, and chemoprevention, as well as the purchase of antimalarial drugs and diagnostics. However, they do not include spending on patient care – e.g., spending on the labor, facilities, and other costs involved in providing care to malaria patients in government health facilities outside of drugs and diagnostics. Because the government spending numbers reported in the Global Fund concept notes and proposals are typically submitted by the same source – NMCPs – and aligned well with the reported numbers in the WMR, we assumed that this spending also did not include patient care.

[Modeling government expenditure on malaria patient care](#)

To estimate government spending on patient care, we built a price-volume model focused on spending on inpatient and outpatient care, respectively, as shown in (1).

$$\begin{aligned}
 Gov_{mal\ patient\ care} = & \hspace{15em} (1) \\
 & (Gov\ cost\ per\ admission_{mal} * Public\ admissions_{mal}) + \\
 & (Gov\ cost\ per\ outpatient\ visit_{mal} * Public\ outpatient\ visits_{mal})
 \end{aligned}$$

In (2) – (5) below, we show the equations used to estimate each element of $Gov_{mal\ patient\ care}$.

Estimates of $Gov\ cost\ per\ admission_{mal}$, shown in (2), were based on country-specific average *inpatient unit cost* of all health conditions from Moses et al. (2018).³ We extracted estimates of malaria inpatient unit costs for 22 country-years from 13 peer-reviewed articles, as shown in Table 2.⁴⁻¹⁶ Only 11 country-years from these studies reported inpatient unit costs without spending on drugs and diagnostics. Therefore, we took the median share of non-drug, non-diagnostic spending and applied it to the remaining 11 country-years to generate $mal\ inpatient\ unit\ cost_{non\ drug\ \&\ non\ diagnostic}$. We converted these values

to 2018 US dollars and took the ratio of these values to the inpatient unit costs from Moses et al. (2018) in the country and year in which the study took place. The median of this ratio (0.69) was applied to all inpatient unit costs to calculate $Gov\ cost\ per\ admission_{mal}$.

$$Gov\ cost\ per\ admission_{mal} = \text{inpatient unit cost} * med \left(\frac{\text{mal inpatient unit cost}_{\text{non drug \& non diagnostic}}}{\text{inpatient unit cost}} \right) \quad (2)$$

Table S2. Malaria inpatient unit costs extracted from peer-reviewed literature

Country	Year	Inpatient unit costs (2018 USD)	Non-drug, non-diagnostic inpatient unit costs (2018 USD)	Study
Bangladesh	2003–2005	60.9		Lubell et al. 2009

Tanzania	2009	20.12		Sicuri et al. 2013
Thailand	2001	211.67	110.57	Kyaw et al. 2014
Uganda	2009	56.54	46.88	Lubell et al. 2011
Zimbabwe	2000	3,120.64	2,912.34	Hongoro and McPake 2003

Public admissions_{mal}, shown in (3), represents the number of inpatient admissions for malaria in government-run health facilities. NMCP programs reported the total number of *inpatient cases_{mal}* to WHO (not disaggregated by the public and private sector but capturing admissions in both sectors), and they are published in WMRs annually. Some missingness characterizes these reported values – malaria inpatient cases were available for 35% of country-years in our sample of 106 countries. For this reason, we modeled logit-transformed malaria admissions as a share of total admissions (from Moses et al. 2018) with spatiotemporal Gaussian process regression (ST-GPR) and the following covariates: malaria Lysenko 5 from the Global Burden of Disease (GBD) study 2017,¹⁷ natural log transformed 10-year lag-distributed income per capita (LDI per capita), whether a country had a policy of providing artemisinin-based combination therapy (ACT) free-of-charge in the public sector as reported in WMRs, and random effects on country, region, and super-region. We back-transformed the dependent variable and multiplied the ratio with *inpatient cases_{mal}* from Moses et al. (2018) to produce total malaria inpatient admissions for each of the 106 countries in our sample over 2000–2016.

$$\begin{aligned}
 & \textit{Public admissions}_{mal} = \tag{3} \\
 & \textit{inpatient cases}_{mal} * \left(\frac{\textit{public treated cases}_{mal}}{\textit{treated cases}_{mal}} \right)
 \end{aligned}$$

public treated cases_{mal} were based on estimates of treatment-seeking in the public sector among children under 5 with a fever in the last two weeks, as estimated by Battle et al. (2016).¹⁸

treated cases_{mal} were from the same source but focused on all treatment-seeking among children under 5 with a fever in the last two weeks. These are the only comprehensive set of estimates of malaria

treatment-seeking available to-date. Furthermore, treatment-seeking rates for malaria among children have been shown to be similar to treatment-seeking among adults.^{19,20}

To impute data for countries not included in the original study, we used a similar approach to Battle et al. (2016) – we modeled logit-transformed public treatment-seeking as a share of children under 5 with a fever in the last two weeks with ST-GPR and the following covariates: logit-transformed out of-pocket (OOP) expenditure as a share of total health expenditure from Global Burden of Disease Health Financing Collaborator Network (2019),²¹ log LDI per capita, coverage of the diphtheria-tetanus-pertussis vaccine, four antenatal care visits, and skilled birth attendance, and the Socio-demographic Index (SDI), all from the GBD 2017 study, and random effects on country, region, and super-region. $treated\ cases_{mal}$ were imputed with a linear mixed model with fixed effects on year and year squared and random effects on region and super-region. Since both $public\ treated\ cases_{mal}$ and $treated\ cases_{mal}$ were modeled as a share of fever cases, we multiplied these ratios by malaria incident cases from GBD 2017 to calculate counts of each measure. We assumed that the share of total admissions in the public sector is similar to the share of all treatment-seeking that occurred in the public sector and thus apply the ratio

$\frac{public\ treated\ cases_{mal}}{treated\ cases_{mal}}$ to $inpatient\ cases_{mal}$ to estimate $Public\ admissions_{mal}$.

Estimating $Gov\ cost\ per\ outpatient\ visit_{mal}$, shown in (4), deploys a similar approach to $Gov\ cost\ per\ admission_{mal}$ in (2). Estimates of $outpatient\ unit\ cost$ for all health conditions were sourced from Moses et al. (2018).²² Malaria inpatient unit costs were extracted from nine peer-reviewed articles.²³⁻³¹ Only five country-years reported outpatient unit costs without spending on drugs and diagnostics. The median share of non-drug, non-diagnostic spending was thus applied to the remaining four country-years studies to generate $mal\ outpatient\ unit\ cost_{non\ drug\ \&\ non\ diagnostic}$. We converted these values to 2018 US dollars and took the ratio of these values to the outpatient unit costs from Moses et al. (2018) in the country and year in which the study took place. The median of this ratio (0.54) was applied to all outpatient unit costs to calculate $Gov\ cost\ per\ outpatient\ visit_{mal}$. Table 3 shows each of the point estimates extracted from peer-reviewed literature.

$$Gov\ cost\ per\ outpatient\ visit_{mal} = \left(\frac{mal\ outpatient\ unit\ cost_{non\ drug\ \&\ non\ diagnostic}}{outpatient\ unit\ cost} \right) \quad (4)$$

Table S3. Malaria outpatient unit costs extracted from peer-reviewed literature

Country	Year	Outpatient unit costs (2018 USD)	Non-drug, non-diagnostic outpatient unit costs (2018 USD)	Study
China	2013–2014	1236.21		Liu et al. 2016
Ghana	2009	3.08		Sicuri et al. 2013
Kenya	2009	3.87		Sicuri et al. 2013
Nigeria	2013	24.38	20.11	Ezenduka et al. 2017
Nigeria	2016	15.57	1.60	Salwu et al. 2016
Papua New Guinea	2007–2008		0.517	Davis et al. 2011
South Africa	2004	27.01		Muheki et al. 2004
Tanzania	2003	2.55		Njau et al. 2008
Tanzania	2009	1.89		Sicuri et al. 2013
Tanzania	2005	6.64	5.51	Wiseman et a. 2006
Zambia	2005	6.99	1.81	Chanda et al. 2007

Estimates of *Public outpatient visits*_{mal}, shown in (5), were based on *Public admissions*_{mal}, estimated as in (3), and the *public treated cases*_{mal} which is an input to those estimates.

*Public admissions*_{mal} were subtracted from *public treated cases*_{mal} to calculate all outpatient visits for malaria in each country over 2000–2016.

$$\begin{aligned}
 & \text{Public outpatient visits}_{mal} = \\
 & \text{public treated cases}_{mal} - \text{Public admissions}_{mal}
 \end{aligned}
 \tag{5}$$

Modeling total government expenditure on malaria

Total government spending is the sum of $Gov_{mal\ patient\ care}$ as described above and the government spending from the NMCP programs, as reported in WMRs and Global Fund proposals and concept notes ($NMCP\ Gov_{mal}$), appended by the government spending on malaria estimated in NHAs ($NHA\ Gov_{mal}$), as shown in (6).

$$\begin{aligned} Gov\ total_{mal} &= NMCP\ Gov_{mal} + Gov_{mal\ patient\ care} \\ &= NHA\ Gov_{mal} \end{aligned} \quad (6)$$

To estimate a full time series for all years and countries in our study, we modelled $Gov\ total_{mal}$ as a share of total government spending excluding government spending on HIV with ST-GPR. We first considered the following covariates: malaria incidence; malaria prevalence; LDI per capita; coverage of indoor residual spraying (IRS), insecticide-treated nets (ITNs), and ACTs; the *Plasmodium falciparum* parasite rate (PFPR); PFPR adjusted for IRS and ITNS; malaria Lysenko 1, 2, and 5 measures; one- and four-visit antenatal care coverage; the Healthcare Access and Quality (HAQ) Index; the proportion of the population living in an urban area; coverage of skilled birth attendance (SBA); the Socio-demographic Index (SDI); and the universal health coverage (UHC) index. All the covariates measured as a proportion were logit-transformed. We sourced all covariate estimates from the GBD 2017 study and the Malaria Atlas Project.

Because the availability of covariate data is higher for sub-Saharan Africa and patterns of incidence and intervention strategies differ from other regions, we split the government malaria spending data into two groups – sub-Saharan African and non-sub-Saharan African countries – and modeled each group separately. We performed covariate selection for each dataset, starting with the set of 19 potential covariates.

We first conducted a lasso regression to determine which covariates were least correlated, conditional on other covariates, with the fraction of government spending on malaria as the dependent variable. Covariates with an estimated coefficient of zero were removed from the set of possible covariates. We then used linear mixed effects regression to estimate all models including all possible combinations of the remaining covariates.

We then selected the intersection of 1,000 best models with the lowest Akaike information criterion (AIC) and Bayesian information criterion (BIC) values. Finally, we completed a 10-fold cross-validation with

out-of-sample predictions on these selected 1,000 models. We selected the best model based on out-of-sample root mean squared error. The top-five models are shown in Table 4. Our final model is model 1 in both SSA and non-SSA sections.

Finally, we used a spatiotemporal Gaussian process regression (ST-GPR) to model government spending on malaria, independently modeling sub-Saharan African countries and non-sub-Saharan African countries. The first stage of ST-GPR was a mixed-effect model with random effects on Global Burden of Disease region and country, as well as the covariates selected using the method described above. To detect and reduce the influence of outlier data points, we used the selected model to measure Cooke's distance for each data point. We excluded each data point if Cooke's distance was greater than $4/n$ where n is the total number of $Gov\ total_{mal}$ data points.

Table S4. Top government spending models based on out-of-sample root-mean square error

SSA	Covariates	OOS RMSE
1	Malaria prevalence, ACT coverage, malaria Lysenko PFPR (highest endemicity), antenatal care (4 visits) coverage (proportion)	0.751537
2	Malaria prevalence, ACT coverage, antenatal care (4 visits) coverage (proportion)	0.751913
3	Malaria prevalence, ACT coverage, malaria Lysenko PFPR (highest endemicity), antenatal care (4 visits) coverage (proportion), Healthcare Access and Quality Index	0.752229
4	Malaria prevalence, ACT coverage, malaria Lysenko PFPR (highest endemicity), antenatal care (4 visits) coverage (proportion), skilled birth attendance (proportion)	0.752298
5	Malaria prevalence, ACT coverage, antenatal care (4 visits) coverage (proportion), Healthcare Access and Quality Index	0.752587
Non - SSA	Covariates	OOS RMSE
1	PFPR adjusted for ITN and IRS coverage, malaria Lysenko PFPR (epidemic), urbanicity, skilled birth attendance (proportion)	0.824391
2	PFPR adjusted for ITN and IRS coverage, malaria Lysenko PFPR (epidemic), skilled birth attendance (proportion)	0.824412
3	PFPR adjusted for ITN and IRS coverage, urbanicity, skilled birth attendance (proportion)	0.824696

4	PFPR adjusted for ITN and IRS coverage, skilled birth attendance (proportion)	0.824799
5	Malaria Lysenko PFPR (epidemic), urbanicity, skilled birth attendance (proportion)	0.824862

3. Out-of-pocket expenditure on malaria

Price-volume model

We found only 55 points of malaria OOP expenditure, all sourced from NHAs. To augment this sparse dataset, we developed a price-volume model of malaria OOP, focused on the OOP costs of malaria treatment. Because of the substantial investment of governments and donors into malaria prevention and control, including financing of insecticide-treated nets, indoor residual spraying, community outreach, and chemoprevention,³² we assumed that the OOP spending on prevention is minimal and focused on estimating the OOP spending on malaria treatment. Our price-volume model is shown in (7). The estimation strategy for each component of (7) is described in (8)–(12).

$$\begin{aligned}
 OOP_{mal} = & \hspace{15em} (7) \\
 & (OOP \text{ cost per admission}_{mal} * Admissions_{mal}) + \\
 & (OOP \text{ cost per outpatient visit}_{mal} * Outpatient \text{ visits}_{mal}) + \\
 & OOP \text{ drug expenditure}_{mal}
 \end{aligned}$$

The approach to estimating volume of malaria treatment-seeking, both $Admissions_{mal}$ and $Outpatient \text{ visits}_{mal}$, are described above. Briefly, inpatient cases were sourced from WHO's WMRs and were modeled as share of all inpatient stays with ST-GPR. $Outpatient \text{ visits}_{mal}$ are $treated \text{ cases}_{mal}$, or treatment-seeking among children under 5 with a fever in the last two weeks based on Battle et al. (2016), minus $Admissions_{mal}$.

$OOP \text{ cost per admission}_{mal}$, as shown in (8), was estimated similarly to $Gov \text{ cost per admission}_{mal}$, with some modifications. Moses et al. (2018) was the source of $inpatient \text{ unit cost}$. We adjusted these country-specific values to reflect the share of unit costs sourced OOP with $\frac{OOP \text{ inpatient spend}}{Total \text{ inpatient spend}}$, data extracted from 471 NHAs. $\frac{OOP \text{ inpatient spend}}{Total \text{ inpatient spend}}$ was logit-transformed and modeled with ST-GPR with

the following covariates: logit-transformed OOP/THE from the Global Burden of Disease Financing Global Health Collaborator Network (2019), natural log-transformed LDI per capita and country, region, and super-region effects. Estimates of OOP spending on malaria admissions (*mal OOP inpatient unit cost*) were extracted from nine peer-reviewed articles,³³⁻⁴¹ shown in Table S5, and converted to 2018 US dollars. To adjust average OOP inpatient unit costs to represent OOP costs per inpatient stay, we computed the median of the ratio $\frac{mal\ OOP\ inpatient\ unit\ cost}{(inpatient\ unit\ cost * \frac{OOP\ inpatient\ spend}{Total\ inpatient\ spend})}$, which amounted to 0.30, and applied it to all other estimates of $inpatient\ unit\ cost * \frac{OOP\ inpatient\ spend}{Total\ inpatient\ spend}$ to generate *OOP cost per admission_{mal}*.

$$OOP\ cost\ per\ admission_{mal} = \left(inpatient\ unit\ cost * \frac{OOP\ inpatient\ spend}{Total\ inpatient\ spend} * med \left(\frac{mal\ OOP\ inpatient\ unit\ cost}{(inpatient\ unit\ cost * \frac{OOP\ inpatient\ spend}{Total\ inpatient\ spend})} \right) \right) \quad (8)$$

Table S5. Malaria OOP inpatient unit costs extracted from peer-reviewed literature

Country	Year	OOP malaria inpatient unit costs (2018 USD)	Study
China	2012	441.80	Xia et al. 2016
DRC	2011	217.19	Ilunga-Ilunga et al. 2015
Ethiopia	2003	67.49	Deressa et al. 2007
Ghana	2009	27.80	Sicuri et al. 2013
Kenya	2009	12.34	Sicuri et al. 2013
Malawi	2012	8.18	Hennessee et al. 2017
Mozambique	2001–2002	7.15	Castillo-Riquelme et al. 2008
Nigeria	2009	7.90	Onwujekwe O et al. 2013
South Africa	2001–2002	1.49	Castillo-Riquelme et al. 2008

Tanzania	2009	6.19	Sicuri et al. 2013
Uganda	2009	8.62	Nabyonga Orem et al. 2013
Zimbabwe	2014–2015	58.99	Gunda et al. 2017

Estimating *OOP cost per outpatient visit*_{mal} employed a similar approach to the strategy applied in (8). We used *outpatient unit cost* from Moses et al. (2018) and adjusted those country-specific estimates to reflect the OOP unit costs of outpatient spending by applying the fraction of outpatient spending sourced OOP ($\frac{OOP\ outpatient\ spend}{Total\ outpatient\ spend}$). These data were extracted from 471 NHAs and were modeled with ST-GPR. As covariates, we used logit-transformed OOP/THE, log LDI per capita, and random effects on country, region, and super-region. As shown in table 6, we extracted 13 country-years of data from 10 peer-reviewed articles to create *mal OOP outpatient unit cost*_{non drug}.⁴²⁻⁵³ To adjust average OOP outpatient unit costs to represent malaria OOP non-drug unit costs, we computed the median of the ratio $\frac{mal\ OOP\ outpatient\ unit\ cost_{non\ drug}}{(outpatient\ unit\ cost * \frac{OOP\ outpatient\ spend}{Total\ outpatient\ spend})}$, which amounted to 0.37, and applied it to all other estimates of *outpatient unit cost* * $\frac{OOP\ outpatient\ spend}{Total\ outpatient\ spend}$ to generate *OOP cost per outpatient visit*_{mal}.

$$\begin{aligned}
 &OOP\ cost\ per\ outpatient\ visit_{mal} = \tag{9} \\
 &outpatient\ unit\ cost * \frac{OOP\ outpatient\ spend}{Total\ outpatient\ spend} * med \left(\frac{mal\ OOP\ outpatient\ unit\ cost_{non\ drug}}{(outpatient\ unit\ cost * \frac{OOP\ outpatient\ spend}{Total\ outpatient\ spend})} \right)
 \end{aligned}$$

Table S6. Malaria OOP non-drug outpatient unit costs extracted from peer-reviewed literature

Country	Year	OOP non-drug outpatient unit cost	Study
Burkina Faso	2000	22.84	Mugisha et al. 2002
China	2012	22.65	Xia et al. 2016

Mozambique	2002	0.22	Castillo-Riquelme M et al. 2008
Nigeria	2013	0.34	Onwujekwe O et al. 2013
South Africa	2002	0.13	Castillo-Riquelme M et al. 2008
Sri Lanka	2004	3.65	Mustafa & Babiker 2007
Uganda	2012	0.03	Matovu et al. 2014
Uganda	2009	3.28	Nabyonga Orem et al. 2013
Vietnam	2004	3.13	Morel et al. 2008

We modeled drug expenditure on malaria broken down by spending on ACTs, which tend to be higher and have a different trend over 2000–2016, separately from other antimalarials, which included monotherapies, chloroquine, and other antimalarials, as shown in (10).

$$\begin{aligned}
 OOP \text{ drug expenditure}_{mal} = & \hspace{15em} (10) \\
 & ACT \text{ price} * ACT \text{ covered cases} + \\
 & Other \text{ antimalarial price} * Other \text{ antimalarial covered cases}
 \end{aligned}$$

Data on OOP spending on ACTs and other antimalarials were sourced from reports on the outlet surveys conducted by ACTwatch (169),⁵⁴ Health Action International (738),⁵⁵ and as reported in a report by the

Affordable Medicines Facility – malaria (AMFm).⁵⁶ The outlet surveys captured the price charged to patients for an array of malaria drugs as well as their availability in private and public drug outlets, including government-run health facilities. For each outlet survey country-year, we took the average across the different ACTs and other antimalarials, respectively, weighted by their availability in different outlet types to approximate access to public and private OOP prices of drugs. All OOP drug prices were converted to 2018 USD. We modeled ACT and other antimalarial OOP prices separately. Since 2000, the average cost of an antimalarial treatment course has decreased substantially,⁵⁷ influenced by negotiations to lower prices by AMF-m and the Global Fund. Furthermore, since 2000, many countries have instituted policies to provide ACTs free-of-charge in the public sector. Therefore, we modeled a country-specific trend for ACTs, incorporating changes to ACT-free policies.

Our main covariate for modeling OOP drug prices was the public procurement price of ACTs, sourced from WHO's Global Price Reporting Mechanism (GPRM),⁵⁸ and the Global Fund's Price and Quality Reporting database,⁵⁹ which capture ACTs procured by NMCPs, non-governmental organizations, and other institutions that received grants from the Global Fund or participate in the GPRM. For each country-year, we took the average procurement price paid for ACTs, weighted by the volume of drugs purchased, and converted all prices to 2018 US dollars. A full time series of ACT procurement prices was modeled with ST-GPR with log-transformed average global price of an ACT treatment course from Management Sciences for Health,⁶⁰ and random effects on country, region, and super-region. We log-transformed OOP ACT price, and applied a robust regression to log-transformed ACT procurement price, and an indicator for whether not ACTs were provided free in the public sector in that country-year, as reported in WHO's WMRs.

Average prices for other antimalarials have not changed substantially in real terms since 2000.⁶¹ However, we wanted to capture regional and country variation in antimalarial OOP drug prices. We therefore modeled log-transformed other antimalarial OOP price with random effects on country, region, and super-region with a linear mixed effects model.

The equations used for ACT-covered cases and other antimalarial-covered cases are shown in (11) and (12). We assumed that all treated cases for malaria received some sort of antimalarial drug. We relied on estimates of ACT coverage among children under 5 with a fever in the last two weeks estimated by Bennett et al. (2017).⁶² These data did not cover countries outside of sub-Saharan Africa, however, and so we imputed ACT coverage for these countries by replicating the same approach employed by Bennet et al. (2017). We extracted the ACTs delivered for each country, as reported in WHO's WMR. To fill in

missing values in this dataset, we modeled log ACTs delivered per incident case in ST-GPR, with log LDI per capita as the sole covariate and random effects on country, region, and super-region. Finally, logit-transformed ACT coverage was modeled with ST-GPR with log ACTs per capita and log LDI per capita and random effects on country, region, and super-region. We multiplied ACT coverage and incidence cases to calculate *ACT treated cases*. We assume that all treated cases that did not get an ACT received another antimalarial. As described in the government spending section, *treated cases_{mal}* were based on Battle et al. (2016), and *inpatient cases_{mal}* were modeled based on the inpatient cases reported in WHO's WMRs. We subtracted *inpatient cases_{mal}* from *treated cases_{mal}* to focus on non-inpatient treatment seeking.

$$\begin{aligned}
 & \text{ACT covered cases} = & (11) \\
 & (\text{treated cases}_{mal} - \text{inpatient cases}_{mal}) * \frac{\text{ACT treated cases}}{\text{treated cases}_{mal}}
 \end{aligned}$$

$$\begin{aligned}
 & \text{Other antimalarial covered cases} = & (12) \\
 & (\text{treated cases}_{mal} - \text{inpatient cases}_{mal}) * \left(1 - \frac{\text{ACT treated cases}}{\text{treated cases}_{mal}}\right)
 \end{aligned}$$

Modeling total out-of-pocket expenditure on malaria

We appended *OOP_{mal}* from the price-volume model to the 55 NHA points to create the full malaria OOP dataset. Using these data, we used ST-GPR to model logit-transformed OOP spending on malaria as a share of total OOP spending excluding OOP spending on HIV. The covariates for this model were LDI per capita, malaria incidence per capita, and the proportion of total OOP over total health expenditure, with random effects for country, region, and super-region.

4. Prepaid private expenditure on malaria

Just 31 country-years of NHA data included prepaid private (PPP) expenditure on malaria. We combined these data with the estimates outlined above for OOP and government spending on malaria and malaria-focused development assistance for health (DAH) data from the Institute for Health Metrics and Evaluation to calculate total spending on malaria.⁶³ As a share of total spending on malaria, median PPP from the 31 NHA country-years was 1.5%. We computed the median ratio of malaria PPP share of non-

PPP malaria spending to total PPP over non-PPP all health spending, as shown in (13), to calculate ρ (.36).

$$\rho = med \left[\frac{\left(\frac{PPP_{mal}}{DAH_{mal} + GHES_{mal} + OOP_{mal}} \right)}{\left(\frac{PPP}{DAH + GHES + OOP} \right)} \right] \quad (13)$$

We re-arranged terms and applied ρ to the estimated $DAH_{mal} + GHES_{mal} + OOP_{mal}$ and total health terms, as shown in (14).

$$PPP_{mal} = \rho * \left(\frac{PPP}{DAH + GHES + OOP} \right) * (DAH_{mal} + GHES_{mal} + OOP_{mal}) \quad (14)$$

5. Malaria elimination status of the 106 countries

Table S7. Malaria elimination status by country

Elimination status in 2016	Countries
Control	Afghanistan Angola Benin Bolivia Brazil Burkina Faso Burundi Cameroon Central African Republic Chad Colombia Congo Côte d'Ivoire Democratic Republic of the Congo Djibouti Equatorial Guinea Eritrea Ethiopia Gabon Ghana Guinea Guinea-Bissau Guyana Kenya Liberia Madagascar Malawi Mali

	Mauritania Niger Nigeria Pakistan Papua New Guinea Peru Rwanda Senegal Sierra Leone Somalia South Sudan Sudan Suriname Tanzania The Gambia Togo Uganda Venezuela Yemen

7. Probabilistic sensitivity analysis

We conducted probabilistic sensitivity analyses using the inputs with the sparsest data: unit costs of malaria inpatient stays and outpatient visits, drug prices, and the ρ in the PPP model. We used the 25th and 75th percentiles of each input and ran the analysis through for the spending category affected by the input. In Table S10, we show the results of these scenarios.

In the *Government* scenario, we ran the patient care component of the government spending model at the 25th and 75th percentiles of the outpatient and inpatient unit costs based on the values in the extracted literature shown in Tables S2 and S3. Once the 25th and 75th percentiles of government spending on patient care were computed based on these inputs, these estimates of patient care were added to the NMCP and Global Fund data, appended to the NHA data, and the whole dataset was modeled with ST-GPR to generate total government spending on malaria.

Two scenarios were assessed for OOP malaria spending. First, similar to the *Government* probabilistic sensitivity analyses, in the *OOP – patient care* scenario, we took the 25th and 75th percentiles of the outpatient and inpatient OOP unit costs, as shown in Tables S4 and S5, and ran the whole model through with these two values. In the *OOP – drug spending* scenario, we used the 25th and 75th percentiles of the OOP drug price data to, similarly, run through the full OOP model and calculate 25th to 75th percentile bounds on OOP spending.

Finally, in the PPP scenario, we calculated the 25th and 75th percentiles of ρ , as shown in equation (13) based on the 31 NHA points and computed PPP based on equation (14) using the two different values.

Table S10. Estimates of government, OOP, and PPP spending on malaria, using the 25th and 75th percentiles of select inputs for 2016

Scenario	Lower	Upper
Government	\$ 962 million	\$ 1,909 million
OOP – patient care	\$ 281 million	\$ 2,268 million
OOP – drug spending	\$ 509 million	\$ 647 million
PPP	\$ 21 million	\$ 288 million

NASAs, National AIDS Spending Assessments

NHA, National Health Accounts

PPP, Purchasing price parity

SFA, Stochastic frontier analysis

ST-GPR, Spatiotemporal Gaussian process regression

THE, Total health expenditure

UNAIDS, the Joint United Nations Programme on HIV/AIDS

USD, United states dollar

1. Overview

In this study, we were interested in extracting data providing information on HIV/AIDS spending at the country level by domestic financing source (domestic, government, private, prepaid private, and out-of-pocket [OOP]) and domestic spending by spending category (care and treatment, prevention, and other). We extracted publicly available data from websites of international institutions and government data aggregators. HIV/AIDS spending data were extracted from seven sources:

- AIDSinfo database published by the Joint United Nations Programme on HIV/AIDS (UNAIDS)
- UNAIDS health financing dashboard
- Global AIDS monitoring (GAM)
- Government and private spending data reported by countries in proposals and concept notes submitted to the Global Fund
- National Health Accounts that capture HIV/AIDS spending, including sub-accounts and accounts that adhere to the System of Health Accounts 2011 (SHA 2011) methodology
- National AIDS Spending Assessments (NASAs)
- Asia Pacific region data downloaded from the AIDS data hub

We leveraged the unique strengths across the different datasets, with the understanding that they were all generated to serve different purposes. The financing data collated by UNAIDS are sourced from annual reporting by countries to UNAIDS, in line with the 2000 Declaration on Commitment to HIV/AIDS. Similarly, countries report domestic spending in concept notes and proposals submitted to the Global Fund to secure funding. The Global Fund requires countries submit these estimates as part of a requirement that they contribute funds to the disease area of focus, in addition to Global Fund contributions. Staff at both the Global Fund and UNAIDS verify the data submitted to them, but in general do not publish data that have been altered from what countries themselves report.

Not all extracted data sources used the same definition of health expenditures. For example, National AIDS Spending Assessment's (NASAs) definition of health expenditure on HIV/AIDS followed a broader definition than the definition of health expenditure provided by National Health Accounts (NHAs). Specifically, NASAs included expenditure on non-health spending categories such as orphans and vulnerable children, creation of an enabling environment, and other social protection services.

To harmonize the definition of HIV/AIDS-related health expenditure among data sources, when provided, we subtracted expenditure related to orphans and vulnerable children, creation of an enabling environment, and social protection services, from the respective sources and functions of health expenditure reported in the NASAs. The three spending categories of orphans and vulnerable children, creation of an enabling environment, and social protection do not represent an exhaustive list of the deviations between NASAs and NHAs' HIV/AIDS spending definition, but do represent the vast majority of this deviation. Other spending categories that were included in NASAs but not included in NHAs were more granular and frequently not reported. Finally, in inspecting some of our data, we noticed the presence of duplicates. This was because many of our data sources drew from the same underlying data (AIDSinfo, UNAIDS' health financing dashboard, NASAs, GAM). We guarded against the inclusion of duplicates by excluding data points that overlapped perfectly or when the value for the previous year was copied for the subsequent year.

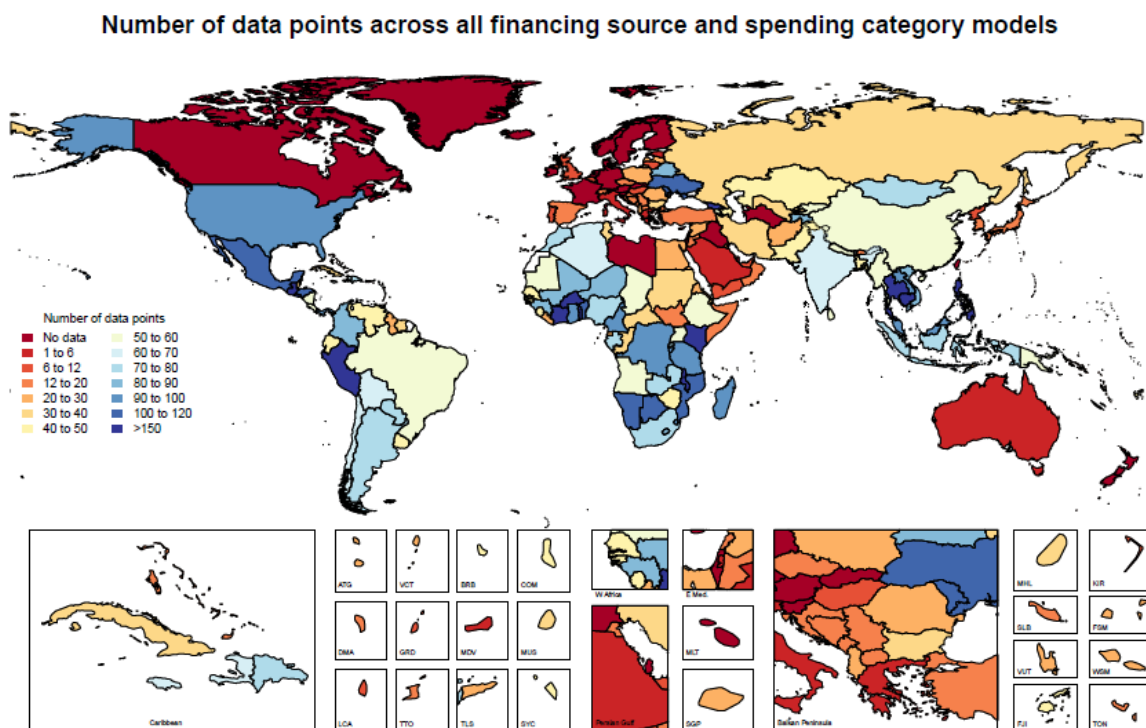

We extracted a total of 8,589 unique data points. Data for government health spending on HIV/AIDS was most substantial, with more than 3,500 data points. The fewest data points existed for HIV/AIDS care and treatment and prevention, respectively amounting to 1,016 and 863 data points. eTable 1 provides breakdowns of the number of data points by year and quantity of interest.

eTable 1. Availability of HIV/AIDS spending data by country. Data density was highest in low- and middle-income countries with a large HIV/AIDS burden, notably Southern and Eastern sub-Saharan Africa; high-income countries, with the exception of the United States, had the fewest data points.

Year	Domestic spending	Government spending	Private spending	Out-of-pocket spending	Prepaid private spending	Domestic care and treatment spending	Domestic prevention spending	Domestic other spending
1996	1	1	1	1	1	0	0	0
1997	1	1	1	1	1	1	1	0
1998	1	1	1	1	1	1	1	0
1999	2	6	2	2	1	1	1	0

2017	4	72	26	0	0	0	0	0

eFigure 1. Map of HIV/AIDS data availability

While the analysis presents on only domestic and government spending on HIV/AIDS in 137 low- and middle-income countries, we used data from high-income countries to inform and improve the overall fit of the models.

2. Currency conversion

All HIV/AIDS expenditure estimates are presented in 2018 United States dollars. Data sources reported spending in either nominal local currency units (LCUs) or nominal United States Dollars (USD). To convert nominal LCUs to United States dollars, we applied deflators to nominal LCU to inflate to 2018 LCUs. We then applied exchange rates to produce 2018 United States dollars. When LCUs were not reported, we extracted reported expenditure in nominal USD, applied corresponding nominal exchange rates to produce nominal LCUs, inflated nominal LCUs to 2018 LCUs with deflators, and finally exchanged 2018 LCUs to 2018 United States dollars. All deflators and exchange rates were extracted from the World Bank,¹ International Monetary Fund,² Penn World Tables,³ the United Nations National Accounts,⁴ and the World Health Organization,⁵ and were imputed to provide a complete series for each of the variables between 1950 and 2018. We then used several models, including ordinary least-squares regression and mixed effects models, to complete each source series from 1950 to 2018. More information about these converters and deflators may be found here.⁶

3. Modeling HIV/AIDS Spending with ST-GPR

As previously mentioned in the manuscript, we used spatiotemporal Gaussian process regression (ST-GPR) to model HIV/AIDS spending for five financing source models (domestic, private, government, prepaid private, and OOP) and three domestic spending category models (prevention, care and treatment, and other). The interested reader may view a complete description of ST-GPR here.⁷ Briefly, ST-GPR has three primary steps. First, a linear mixed effects model is run with a given set of predictors. Predictions from the first step provide the general trend within the data. In the second step, spatiotemporal patterns were estimated by applying a series of spatiotemporal weights to average the residuals of the first step linear model. These spatiotemporal patterns were then added to the linear prediction to generate spatiotemporal predictions. Finally, the spatiotemporal predictions served as the mean function of a Gaussian process regression run across time on the data. Estimates of the Gaussian process regressions served as final ST-GPR predictions and generated a complete time-series of data from 2000 to 2016 in 137 countries, building from data when available and borrowing strength across time, geographic regions, and covariates' predictive power when data were not available.

For the first step of ST-GPR – the linear model – we used a linear mixed effects regression with random effects on Global Burden of Disease (GBD) super-region and GBD region. For prediction in these models, we considered a range of covariates: 10-year lagged distributed income (LDI), HIV prevalence, incidence, mortality, and antiretroviral coverage and price. The exact set of covariates for each model was determined based on out-of-sample predictions and presented in eTable 2. All covariates were sourced from GBD 2017.^{8,9} Within the linear model step, we measured each data point's Cook's distance, and after checking to ensure the data were properly extracted, we excluded every data point with a Cook's distance exceeding $4/n$, where n is the total number of data points within the model.

In the second step, we created spatiotemporal predictions by smoothing the predictions from the first step model based upon systematic deviations in the residuals of the first step model across time and

geographic locations. The spatiotemporal predictions were passed as the mean function to a Gaussian process regression along with the data to produce final ST-GPR predictions. For every country-year estimate, 1,000 draws were generated from the Gaussian process regression model, which were later used in subsequent calculations.

eTable 2. Covariates used in ST-GPR

ST-GPR model	Covariates
Domestic	ART price, ART coverage, HIV/AIDS prevalence, HIV/AIDS mortality rate
Government	ART coverage, HIV incidence, HIV/AIDS mortality
Private	LDI, ART price, HIV/AIDS prevalence
OOP	ART coverage, HIV/AIDS prevalence, HIV incidence, HIV/AIDS mortality rate
Prepaid private	ART price, ART coverage, HIV/AIDS prevalence, HIV incidence, HIV/AIDS mortality
Domestic HIV/AIDS spending on care and treatment	ART coverage, HIV/AIDS prevalence, HIV incidence, HIV/AIDS mortality rate
Domestic HIV/AIDS spending on prevention	ART coverage, HIV/AIDS prevalence, HIV incidence, HIV/AIDS mortality rate
Domestic HIV/AIDS spending on all other functions	ART price, ART coverage, HIV incidence

4. Enforcing internal consistency

To ensure internal consistency between the HIV/AIDS spending estimates and the all-health-spending estimates⁶, HIV/AIDS spending by source was modeled as the logit transformed fraction of the respective, loess smoothed, all health spending by financing source estimate (e.g., domestic HIV/AIDS spending divided by all domestic health spending). As a consistency check, extracted data points were outliered if the fraction of HIV/AIDS spending by source and all health spending by source exceeded one.

While the above transformation helped ensure internal consistency between HIV/AIDS spending and all health spending, we were still required to ensure internal consistency within our estimates such that government HIV/AIDS spending did not exceed domestic HIV/AIDS spending, and further we wished to take advantage of all the extracted data within the implemented models. These objectives were accomplished by both aggregating and raking. Aggregating is the process of summing mutually exclusive

and collectively exhaustive estimates of sub-components of health expenditure (e.g., OOP, prepaid private, government spending, development assistance) and using the sum as the estimate of total health expenditure. Raking is the exact opposite of aggregating. In raking, we used estimates of total health expenditure to evenly scale the estimated sub-components to ensure the sub-components sum to the estimated total health expenditure. Raking and aggregating are equally valid and widely used in health financing and in the Global Burden of Disease.^{8,9}

In our extracted dataset, few data sources (NHAs and NASAs) reported OOP, prepaid private, or total HIV/AIDS spending (sum of OOP, prepaid private, government, DAH-HIV/AIDS), while nearly all data sources reported expenditure of either government, private (sum of OOP and prepaid private, but not disaggregated), and total domestic (sum of government and private, but not disaggregated) HIV/AIDS spending. Given this inconsistency, we modeled the five financing source spending variables and raked and aggregated estimates to draw strength across areas with the highest data density. This process was implemented by averaging the domestic HIV/AIDS spending estimates with the aggregated domestic HIV/AIDS spending estimate formed by summing estimates of government and private HIV/AIDS spending. This averaged result represented our final estimate of domestic HIV/AIDS spending. We then raked estimates of government and private HIV/AIDS spending to the final domestic HIV/AIDS spending envelope to produced final private and government HIV/AIDS spending estimates. The final private HIV/AIDS spending estimates were then used as an envelope to rake OOP and prepaid private HIV/AIDS spending estimates. To propagate uncertainty, we conducted both aggregating and raking on the draw level. For estimates of total HIV/AIDS spending, we deterministically added development assistance, source from published literature,⁶ to total domestic HIV/AIDS spending

To generate estimate of domestic HIV/AIDS spending by spending category (prevention, care and treatment, and other), we estimated domestic spending by spending category as the logit transformed fraction of total domestic spending. Not only did these models draw on reported domestic spending by spending category, but they drew on data reporting total spending by spending category. We equated these latter data to domestic spending by spending category by subtracting estimates of development assistance from analogous spending category. This process required us to map development assistance by HIV/AIDS health focus area to our spending categories. This mapping is presented in eTable 4. If this process of equating data resulted a negative value, after checking the data point of incorrect extraction, we dropped the data point.

Estimates of domestic spending by spend category were raked to the total domestic spending envelope. Final estimates of HIV/AIDS spending by spending category were created by deterministically adding domestic spending to development assistance by spending category.

eTable 3. Aggregation of development assistance for HIV/AIDS by health focus area into HIV/AIDS spending categories.

HIV/AIDS spending functions	Development assistance for HIV/AIDS by health focus area.
Prevention	Prevention, PMTCT
Care and treatment	Treatment, care, counseling and testing
Other	Health systems strengthening
	Unidentified

5. Estimating potential government spending

We used stochastic frontier analysis (SFA) to estimate the potential for governments to spend additional resources on HIV/AIDS. Stochastic frontier analysis (SFA) is an econometric regression method that incorporates two error terms: (1) a normal distributed error term common in most linear regressions, and (2) a one-sided error term with an assumed truncated normal distribution. As described in the manuscript, the latter error term can then be converted into an efficiency score measured on the interval of zero to one. We used this efficiency score to estimate governments' potential to spend additional resources. We assumed the one-sided error term followed a truncated normal distribution, an assumption that is generally considered extremely flexible.¹⁰

In our SFA regression, we regressed our log government spending on HIV/AIDS per capita against a set of covariates: LDI, HIV prevalence, HIV incidence, HIV mortality, the Healthcare Access and Quality Index,⁵ general government expenditure per capita less total government spending on health per capita,⁸ and government spending on health per capita less government spending on HIV/AIDS per capita. We used the natural log of all covariates. As described in the manuscript, we additionally chose to include all possible covariate interactions in our selected model. This decision was made after testing several SFA model specifications commonly used in the literature. Specifically, we assessed the Cobb-Douglas specification (all first order terms), a quadratic specification (first and second order terms), an interaction specification (all first order terms and all possible first order interactions), and finally the translog specification (all first and second order terms and all possible first order interactions). First order terms are defined as the standard set of covariates mentioned above and second order terms are defined as the square of all first order terms after taking the natural log. These four specifications were evaluated on the basis of Bayesian information criteria (BIC) – a goodness of fit statistic that penalizes complex models. As seen in eTable #4, the BIC for the interaction specification had the lowest BIC among all models tested, which suggested that it was the best-performing model.

6. Development assistance for health

Development assistance for health (DAH) estimates were obtained from the Institute for Health Metrics and Evaluation's development assistance for health database. A more detailed description of the methodology used to obtain the estimates in the database can be found in Dieleman et al.⁶ All known, systematically reported, available data on health-related disbursements and expenditures were extracted, as well as income and revenue from existing project databases, annual reports, and audited financial statements. DAH for bilateral agencies included all health-related disbursements from bilateral donor agencies, excluding funds that they transferred to any of the other channels we tracked in order to avoid double-counting. This information was extracted from the Creditor Reporting System (CRS) and Development Assistance Committee (DAC) databases of the Development Assistance Committee of the Organisation for Economic Co-operation and Development (OECD/DAC).

In some cases, donor agencies did not report disbursement data to the CRS. A method for predicting disbursements from commitment data was implemented to address this challenge. For other grant- and loan-making institutions, annual disbursements on health grants and loans were similarly included, excluding transfers to any other channels and ignoring any repayments on outstanding debts. The annual disbursements for grant- and loan-making institutions only reflect the financial transfers made by these agencies. Therefore, in-kind transfers from these institutions in the form of staff time for providing technical assistance and the costs of managing programs were estimated separately. Estimates of DAH for the United Nations (UN) agencies included annual expenditures on health both from their core budgets and from voluntary contributions. Non-governmental organizations' (NGOs) DAH estimates utilized data

from US government sources, Guidestar Research Fundamental Plus dataset and a survey of health expenditure for a sample of NGOs to estimate DAH from US-based and internationally based NGOs receiving support from the US government. To allocate DAH to HIV/AIDS and the program areas within development assistance for HIV/AIDS, we used a keyword search and tagged spending based on a weighted average of keywords. Extensive details about all the steps involved in estimating DAH are in Dieleman et al.

7. Stochastic frontier analysis model selection

As mentioned in the manuscript, the estimates of efficiency in stochastic frontier analyses are impacted by selection of the functional form, i.e., the choice of covariates within the model. We evaluate four commonly implemented functional forms found within the literature: Cobb-Douglas specification (model with first order terms [maximum power is one]), quadratic specification (model with first order term and second order terms), interaction specification (model with first order terms and interactions), and a translog model (a model with first and second order terms and all possible interaction between first order terms). In comparing these models, we selected the model with the lowest Bayesian information criteria, which was the interaction model. Table S2 presents the Bayesian information criteria for each functional forms tested. Additionally, in Table S2 we estimate the additional potential government spending for all low- and middle-income countries under each model as a sensitivity analysis to display how sensitive our results are to the choice of model selection.

eTable 4. Bayesian information criteria from stochastic frontier models

Functional form	Bayesian information criteria	Estimated potential additional government spending at the global level (measured in billions; USD 2018)
Cobb-Douglas	348	4.5
Quadratic	345	3.4
Interaction	397	4.3
Translog	313	12.1

8. Comparison of potential spending to the literature

As mentioned in the manuscript, comparison of our estimates of governments' potential to spend additional resources on HIV/AIDS to the existing literature proves difficult due to the methods implemented, the unit of measurements (governments' versus countries' total domestic spending), and the aim of the study (i.e., assessing what governments *could* spend opposed to what governments/countries *should* spend domestically). Despite these difference, in Table S3 we compare our estimates of what governments could spend to Remme et al.'s 2016¹¹ regression-based estimates of 14 governments' potential spending on HIV/AIDS. All estimates are reported in spending per person living with HIV/AIDS in 2018 USD.

eTable 5. Comparison of governments potential spending on HIV/AIDS per person living with HIV/AIDS

Country	Remme et al 2016 estimated potential spending by governments	IHME estimated potential spending by governments
Botswana	3,287	557
Ethiopia	184	230
Kenya	465	101
Lesotho	404	100
Mozambique	74	43
Malawi	105	24
Namibia	1,923	573
Nigeria	195	83
Swaziland	576	269
Tanzania	183	76
Uganda	87	37
South Africa	1,223	429
Zambia	187	116
Zimbabwe	83	96

Note: All estimates are reported in 2018 USD. Remme et al 2016 estimates were retrieved using software that analyzed a figure in their analysis, as estimates of governments' potential spending were not reported in a table or text.

Remme et al 2016 estimates ranged from 80% to nearly six times more than our estimates (median was 2.4 times higher). This result suggests our estimates of governments potential spending may be significantly less than previously thought.

9. Results in purchasing price parity

In Table S4 we present our spending results in 2018 purchasing price parity (PPP), as opposed to 2018 USD as reported in the main text.

HIV/AIDS spending in 2018 PPP dollars in 2016			
Location	Total spend on HIV/AIDS in millions of USD	Total government spend on HIV/AIDS in millions of USD	Potential government spend on HIV/AIDS in millions of USD
World Bank Income Group			
World Bank low-income	7,804.3 (7,214.3 to 8,801.1)	851.2 (427.8 to 1,522.8)	1,066.3 (566.8 to 1,859.5)
World Bank lower-middle-income	9,588.0 (7,842.8 to 12,388.0)	3,611.4 (2,247.2 to 5,602.4)	5,083.7 (3,052.9 to 8,145.6)
World Bank upper-middle-income	19,793.7 (13,036.5 to 30,253.1)	16,877.9 (10,991.2 to 24,957.4)	20,097.4 (14,110.4 to 28,498.7)
GBD super-region			
Central Europe, Eastern Europe, and Central Asia	2,455.6 (1,635.8 to 3,687.2)	2,005.1 (1,207.0 to 3,213.8)	2,387.7 (1,371.4 to 3,950.9)

Latin America and Caribbean	7,680.6 (5,082.9 to 11,865.3)	6,095.1 (4,143.7 to 8,429.1)	2,361.0 (1,543.0 to 3,528.6)
North Africa and Middle East	1,217.2 (741.5 to 1,968.0)	1,073.9 (619.8 to 1,766.8)	132.6 (79.9 to 208.3)
South Asia	2,008.0 (1,441.2 to 2,871.7)	1,337.2 (879.8 to 2,010.3)	1,465.2 (965.2 to 2,191.9)
Southeast Asia, East Asia, and Oceania	4,724.7 (3,816.1 to 5,881.6)	3,745.2 (2,872.5 to 4,850.0)	14,420.4 (10,828.7 to 19,147.8)
Sub-Saharan Africa	18,451.2 (14,925.9 to 24,274.1)	6,439.2 (3,496.9 to 10,923.8)	5,023.9 (2,625.6 to 8,846.6)
Country			
Afghanistan	23.7 (20.1 to 31.5)	2.0 (0.8 to 3.4)	4.6 (1.9 to 7.8)
Albania	4.4 (3.0 to 6.2)	4.2 (2.9 to 5.9)	7.2 (5.0 to 10.0)
Algeria	65.8 (45.6 to 102.4)	65.2 (45.2 to 101.6)	0.0 (0.0 to 0.0)
American Samoa	0.3 (0.2 to 0.4)	0.3 (0.2 to 0.4)	0.0 (0.0 to 0.0)
Angola	162.0 (121.6 to 213.2)	112.4 (71.9 to 163.7)	0.0 (0.0 to 0.0)
Argentina	648.7 (450.2 to 894.3)	644.6 (446.5 to 889.0)	456.7 (316.3 to 629.8)
Armenia	14.5 (12.1 to 18.1)	6.7 (4.4 to 10.4)	8.1 (5.3 to 12.6)
Azerbaijan	45.5 (32.6 to 65.7)	27.7 (14.9 to 47.8)	13.5 (7.2 to 23.2)
Bangladesh	35.0 (29.3 to 42.4)	15.5 (10.3 to 22.9)	20.1 (13.4 to 29.6)
Belarus	68.0 (51.4 to 87.3)	50.0 (35.5 to 67.9)	0.0 (0.0 to 0.0)
Belize	3.8 (2.7 to 5.5)	3.0 (2.1 to 4.4)	1.7 (1.1 to 2.5)
Benin	55.4 (50.0 to 63.5)	12.2 (7.1 to 20.1)	4.6 (2.7 to 7.6)
Bhutan	5.3 (4.6 to 6.7)	2.4 (1.6 to 3.8)	0.0 (0.0 to 0.0)
Bolivia	30.4 (20.5 to 46.5)	19.3 (10.6 to 32.5)	35.6 (19.6 to 60.0)
Bosnia and Herzegovina	12.1 (8.7 to 16.9)	10.7 (7.3 to 15.6)	0.0 (0.0 to 0.0)
Botswana	596.4 (413.3 to 849.9)	458.8 (291.8 to 654.1)	0.0 (0.0 to 0.0)
Brazil	4,236.5 (2,583.8 to 7,110.0)	3,619.4 (2,493.3 to 4,790.5)	0.0 (0.0 to 0.0)
Bulgaria	21.5 (15.4 to 29.9)	18.5 (12.5 to 26.7)	28.8 (19.5 to 41.7)
Burkina Faso	84.8 (60.3 to 123.8)	34.1 (13.9 to 70.0)	0.0 (0.0 to 0.0)
Burundi	56.8 (53.7 to 62.3)	5.2 (2.3 to 10.6)	3.2 (1.4 to 6.5)
Cambodia	99.8 (90.3 to 113.2)	21.3 (12.5 to 32.9)	134.7 (79.4 to 208.5)
Cameroon	170.7 (148.4 to 213.6)	31.2 (13.2 to 65.9)	71.4 (30.2 to 150.7)
Cape Verde	3.0 (2.1 to 4.4)	2.8 (1.9 to 4.1)	1.5 (1.0 to 2.2)
Central African Republic	18.0 (17.4 to 19.0)	1.1 (0.7 to 1.5)	0.5 (0.3 to 0.7)
Chad	42.1 (34.6 to 56.3)	16.4 (9.2 to 30.0)	0.0 (0.0 to 0.0)
China	2,088.0 (1,600.7 to 2,714.2)	2,064.2 (1,581.9 to 2,690.7)	12,561.2 (9,626.5 to 16,373.6)
Colombia	319.7 (222.7 to 444.1)	205.1 (118.9 to 323.9)	439.2 (254.7 to 693.6)
Comoros	3.6 (3.3 to 4.2)	0.4 (0.1 to 0.8)	0.5 (0.1 to 1.1)
Congo	72.1 (55.4 to 94.7)	55.7 (39.3 to 77.5)	0.0 (0.0 to 0.0)
Costa Rica	52.3 (40.5 to 70.6)	37.1 (30.7 to 44.7)	124.3 (103.0 to 149.7)
Côte d'Ivoire	302.3 (280.9 to 341.0)	41.3 (23.9 to 69.0)	178.7 (103.6 to 298.8)

Croatia	25.6 (18.6 to 35.4)	25.5 (18.5 to 35.2)	17.1 (12.5 to 23.7)
Cuba	313.6 (222.4 to 432.7)	290.5 (202.7 to 401.3)	228.4 (159.3 to 315.4)
Democratic Republic of the Congo	225.2 (190.9 to 296.7)	16.0 (5.3 to 31.7)	0.0 (0.0 to 0.0)
Djibouti	4.3 (3.7 to 5.3)	1.5 (1.0 to 2.2)	3.2 (2.1 to 4.6)
Dominica	0.5 (0.4 to 0.7)	0.3 (0.2 to 0.5)	0.5 (0.3 to 0.8)
Dominican Republic	161.4 (111.2 to 243.9)	58.1 (38.0 to 85.4)	284.6 (186.3 to 418.5)
Ecuador	39.6 (28.2 to 54.6)	31.6 (21.6 to 45.0)	144.5 (98.8 to 206.2)
Egypt	91.5 (55.4 to 148.6)	82.8 (50.8 to 125.2)	0.0 (0.0 to 0.0)
El Salvador	123.2 (96.4 to 159.8)	102.8 (80.6 to 129.7)	0.0 (0.0 to 0.0)
Equatorial Guinea	21.5 (10.1 to 42.1)	19.4 (9.7 to 33.8)	25.2 (12.6 to 43.9)
Eritrea	17.8 (16.8 to 19.7)	2.2 (1.3 to 3.1)	2.0 (1.2 to 2.9)
Ethiopia	783.8 (732.2 to 869.7)	90.4 (40.0 to 174.5)	316.4 (139.9 to 611.0)

1 Data

1.1 Summary of Data Sources

We used data from seven sources for the analyses:

- World Health Organization’s (WHO) Global Health Expenditure Database
- Institute for Health Metrics and Evaluation’s Development Assistance for Health Database (IHME)
- International Monetary Fund’s (IMF) World Economic Outlook (WEO) database
- Penn World Tables 9.0 (PWT)
- World Bank (WB) World Development Indicators database (WDI)
- Angus Maddison Project
- United Nations (UN) World Population Prospects (WPP)

Specifically, we collected health expenditure information on all available sources that is comparable across countries and complete for most countries from WHO and IHME, and demographic data from the WPP, while the underlying data for producing gross domestic product (GDP) and general government expenditure (GGE) were extracted from the IMF, WB, and PWT. Table 1 presents the definitions for the various health expenditure sources.

1.2 Institute for Health Metrics and Evaluation’s Development Assistance for Health Database

Development assistance for health estimates were obtained from the Institute for Health Metrics and Evaluation’s Development Assistance for Health Database. To generate these estimates, IHME collected audited budgets, annual reports, and project records from the primary development agencies providing assistance for the health sector. These records are augmented by information acquired via correspondence, and are standardized and compiled to provide a comprehensive perspective on international financial flows for health. These estimates are tracked backward to the source of the funds and forward to the country recipient, and are available from 1990 through 2018 and 2016, respectively.

1.3 World Health Organization’s Global Health Expenditure Database

We used Global Health Expenditure Database (GHED) data from WHO to generate our estimates, which span 185 countries between 2000 through 2016. From the GHED, we pulled the following variables:

- (i) Compulsory prepayment (Other, and unspecified, than FS.3)
- (ii) Other revenues from NPISH n.e.c.
- (iii) Other revenues from corporations n.e.c.
- (iv) Other revenues from households n.e.c.
- (v) Social insurance contributions
- (vi) Transfers from government domestic revenue (allocated to health purposes)
- (vii) Gross Domestic Product
- (viii) Voluntary prepayment

To ensure we were using the best possible data, we downloaded the metadata for each data point for all of the indicators from the GHED website. We used the metadata to decide how each given data point should be weighted, from 1 to 5, being applied as inverse variance weights. We established guidelines for the metadata that informed how the underlying data points should be weighted, giving priority to factors such as complete, documented source information and penalizing factors such as having been derived or estimated. We adjusted these data by converting them from current local currency to 2018 US\$. Details of the weighting guidelines and classification are explained in the supplementary appendix our retrospective analysis paper.

Once we have an incomplete set of data points for the health expenditure variables we are interested in forecasting, we used spatiotemporal Gaussian process regression (ST-GPR) to model the full time-series for each variable across a total of 195 countries. ST-GPR is a stochastic modeling technique that is designed to detect signals amid noisy data. Unlike classical linear models that assume that the trend underlying data follows a definitive functional form, GPR assumes that the specific trend of interest follows a Gaussian process, existing with some pointwise mean and covariance function. [1]. The covariates that were used in order to determine the initial fit of our health expenditure variables are lag-distributed income, all-sector government expenditure per capita, Healthcare Access and

Quality Index [2], and proportion of total population over the age of 64; using a Matérn co-variance function for the distribution of the Gaussian process. Once we determined an initial prediction of our dependent variables, using the variability of data across regions, Gaussian process regressions (GPR) were run in order to estimate 1,000 draws of each country-year estimate per metric.

1.4 United Nations World Population Prospects 2017

The United Nations (UN) World Population Prospects (WPP) provides population estimates and forecasts by age, sex, country, and year from 1950 until 2100. Using a cohort-component approach, WPP utilizes life tables to generate forecasts of age-specific mortality rates. Their modeling strategy involves a hierarchical Bayesian model (with an AR(1) process) of female life expectancy (with male life expectancy being highly correlated with female's) that prioritizes country data if available, but otherwise draws on regional data [3, 4]. A separate step models the male-female difference in life expectancy. From their final data source, we generate multiple indicators of demographic context, such as the total fertility rate (TFR), the proportion of the population under the age of 20, the proportion aged 65 years and over, and the total population for each country and year.

For a certain set of countries where either age-sex-specific population or the TFR data were missing, we used a combination of a secondary data source (the US Census Bureau [5], which spanned from 2000 through 2050) and the Global Burden of Disease (GBD) region-specific rate of change to fill in and extrapolate, therefore giving us complete country-year time series for TFR and age-sex-specific population spanning from 1950 through 2099 (2099 being the final year of TFR data available for other countries with existing data points).

1.5 WB, IMF, PWT, and Maddison

The WDI Database provides data on a wide range of development-related variables, including data on GDP and GDP per capita. Data series in this database begin in 1960. The IMF's WEO Database provides data on various macroeconomic indicators. Macroeconomic series data are available from 1980 to present. The PWT is a database that provides real national accounts data for 167 countries and territories. The data series starts in 1950. The Maddison Project database provides historical GDP, GDP per capita, and population data dating as far back as Roman times. We utilized GDP per capita as a primary covariate to produce forecasts. GDP per capita from 1950 through 2017 was constructed using the method described in *James et al.*[6] The method utilized extracted data from a number of sources (IMF, WB, PWT and Maddison), and used multiple random effects models to

estimate a mean GDP per capita series to be used in our analysis. Similarly, we used the same methodology to produce a mean general government expenditure (GGE) per GDP series, from 1980 through 2017.

In order to forecast GDP per capita, we first convert GDP per capita to GDP per working population in the following manner:

$$\text{GDP}_{\text{working population}} = \text{GDP}_{\text{total population}} \times \frac{\text{Working population (20-64 years old)}}{\text{Total Population}}$$

We forecast GDP per working population from 2018 to 2050 and convert back to GDP per capita for further analysis. The out-of-sample root-mean-squared-error (RMSE) based on using GDP per working population was smaller than forecasting with GDP per capita.

2 Covariates

2.1 List of forecasted variables

The following are the list of variables which are forecasted in the manuscript:

- GDP: Gross Domestic Product (national income of a country)
- GGE: General Government Expenditure (all sector government expenditure in a country)
- DAH_d : Development Assistance for Health donated
- DAH_r : Development Assistance for Health received
- GHE: Government Health Expenditure
- OOP: Out-of-pocket Private Expenditure
- PPP: Prepaid Private Expenditure
- THE: Total Health Expenditure

2.2 Covariates used for forecasting

The following covariates are used as predictors, or independent variables, in our models:

- Total population of a country (1950–2050)
- Proportion of total population below the age of 15 (1950–2050)
- Proportion of total population above the age of 64 (1950–2050)
- Total Fertility Rate (1950–2050)
- Education attainment per capita [7, 8] (1980–2050)
- An indicator variable used to denote the anomalous disbursement of DAH in our DAH_d forecasts (1 for years in 2000–2010, 0 otherwise)
- An indicator variable used to denote the Ebola crisis in Guinea, Sierra Leone, and Liberia in our DAH_r forecasts (1 for years in 2014 and 2015 for the three aforementioned countries, 0 otherwise).

Additionally, we also use the forecasted GDP and GGE per capita as covariates to predict the health expenditure variables. Section A.1 in the Tables and Figures section shows our full pathway for forecasting all our endogenous variables and how each of those variable fed into a succeeding model.

3 Ensemble modeling

The purpose of ensemble modeling is to make sure that we capture the most out of what we have in our arsenal in terms of covariates and model specifications. We are agnostic about one model being the sole predictor of the future, and allow an ensemble of beliefs about predicting off of the past trends. "Ensembling," in simple terms, is a way of pooling a number of sub-models, where the space of sub-models span different inclusions and combinations of predictors, and/or different econometric specifications.

3.1 Sub-model setup

Our basic sub-model is a linear mixed effect model of the following form, for country i and time t :

$$\Delta_t Y_{i,t} = (\alpha + \alpha_i) + \left(\sum_{p=1}^3 \rho_p \Delta_t Y_{i,t-p} \right) + \Delta_t X' \beta + \varepsilon_{i,t} \quad (1)$$

where

$$(\alpha, \vec{\beta}) \quad \text{(Fixed effects)} \quad (2)$$

$$\alpha_i \sim N(0, \sigma_a^2) \quad \text{(Country specific random intercept)} \quad (3)$$

$$\varepsilon_{i,t} \sim N\left(\sum_{m=1}^3 \phi_m \varepsilon_{i,t-m}, \sigma_i^2\right) \quad \text{(Autocorrelated residuals as time random effects)} \quad (4)$$

'Fixed effect' is the equivalent of a non-random coefficient in a linear regression setting, and is estimated globally across all countries and time periods. The likelihood function for the data were all set to be Gaussian distributions for all of our metrics and models.

3.2 Covariates

Using our linear baseline model as defined in section 3.1, we created our set of ensemble sub-models by using all combinations of each of the covariates in Table A.2. For example, if we were predicting GDP per capita with TFR and Population as the predictors, then we would get a possible combination of four specifications to use (including one with no fixed effects). All covariates were included as fixed effects, and all specifications had the random effect on country intercepts.

3.3 Convergence to global growth rates

We believe that the very-long-term trajectory of a variable forecasted for each country will gradually taper to the global growth rates. The way that we implemented this growth rate convergence is in the following manner:

- 1) Suppose that we are forecasting $Y_{i,t}$, which includes an intercept at the global level and the country level. Let us also assume that there were \tilde{T} time periods of Y observed in the past for each country i .
- 2) We start the tapering of the growth rate to start from 10 years before \tilde{T} into the future starting from the present, converging to the global value 10 years after \tilde{T} . Therefore, if the present time period is H , then our decaying scheme will start off from the year $h + \tilde{T} - 10$ and end at $h + \tilde{T} + 10$.
- 3) Our main objective is to slowly taper all the countries' random intercepts to decay to zero, so that they are all following a global intercept. In a first-difference model, since the intercepts represent the linear time trend, this scheme will slowly converge the linear time trends of all countries to decay to the global time trend.
- 4) Starting from the first year of decay, we will transform the country specific intercepts as such:

$$\hat{\alpha}_i = (\hat{\alpha}_i) \times \frac{20 - t}{20}$$

where t are all the time periods between $h + \tilde{T} - 10$ and $h + \tilde{T} + 10$.

- 5) By the time t reaches $h + \tilde{T} + 10$, the value of $\hat{\alpha}_i$ will have decayed to zero, and therefore, all the countries will have reached a global linear time trend estimate.

3.4 Specifications

- 1) **ARIMA (Autoregressive Integrated Moving Average) terms:** We allowed up to three degrees of lags in the model (traditional auto-regressive terms), where each degree of AR term will include itself and all other lower degrees of lags. For example, a GDP per capita model with AR(3) specification (predicting log of GDP per capita) will include once, twice, and thrice lagged log GDP per capita term. These were included as fixed effects.

Additionally, in order to predict the best set of fixed effect coefficients, we test and include auto-correlated residuals in our models (traditional moving-average terms in an ARIMA setup). This basically means that we allow our models to estimate the residuals with

an autoregressive process of their own. These were included as random effects, and we allowed this to exist at the country-year level.

All of the variables we forecasted used the first-differences transformation (across time) as the dependent variable, except DAH received which was forecasted in non-differenced space, because of the presence of very high noise, thereby making the differenced series very unstable to forecast.

- 2) **Recency weights:** One of the other specifications we included in our sub-models was the option of weighting the recent years higher. This is particularly helpful for countries like Ethiopia and Nigeria, where they had rapid economic growth in recent years, and we believe that is a better predictor of the GDP forecasts than the further past. The weighting function was defined as such:

$$\text{Weight} = f(\tau, t) = (T - t + 1)^\tau \quad (5)$$

where T is the final year of in-sample data we have, and t is the year at that data point. This is an exponential decaying weighting function, where the degree of decaying is determined by τ , and we test and include a set of values of τ ranging between 0 and 0.5, where $\tau = 0$ refers to equal weights (all time periods are weighed equally at 100). Given that $\left. \frac{df(\tau, t)}{dt} \right|_{\tau > 0} < 0$, this allows to weight our data with higher contributions to the likelihood from the recent past, and slowly decaying as we move further into the past towards the first observed time period. These recency weights were multiplied with the pointwise data variance parameter in order to weight the data points.

- 3) **Convergence Term:** We also allowed for the inclusion of a ‘convergence term’ in the list of sub-models. A convergence term is the one-year lag of the non-differenced dependent variable, and gets updated as each year is forecasted in the future. If a convergence term was considered in a sub-model, then we only included that sub-model if the coefficient on the convergence term was estimated to be negative (and statistically significant at 10% level).

4 Package and Architecture

4.1 Architecture

All analysis and forecasting were done on a parallel computing cluster with 20,000 nodes with a CentOS interface. We compiled R[9] version 3.5.1 from source code on a Docker based on Debian OS, which was deployed as a Singularity container with all the necessary compilers and binaries (GCC, G++ and Fortran 8.2.0).

4.2 Template Model Model

We used the R library **TMB**[10] to run our baseline mixed effects models. TMB stands for Template Model Builder, and it's a powerful method of approximating the integral of the Gaussian probability distribution function (which doesn't exist in closed form) by using a Laplace Approximation, which gives very precise results, and is relatively faster than other approximation packages which exist like Stan or Bugs. TMB uses automatic differentiation on the negative log-likelihood function in order to optimize the model parameters, and also returns a sparse joint precision matrix, from which we can simulate posterior parameter draws.

5 Inclusion and Exclusion Criteria

After we ran all possible combination of our sub-models and created a mean set of forecasts, we only want to keep the best possible set of sub-models. Hence, we implied the following set of inclusion and exclusion criteria in order to filter out the ‘unrealistic’ sub-models:

- (1) All of the estimated coefficients must be **statistically significant at 10% level of significance**. For the fixed effects, we took the mean and the standard deviation of the posterior estimates, and filtered out the sub-model if the absolute z-score is below 1.645 (the absolute value of the one-sided 95th quantile of a standard normal distribution). For the random effects, we look at the whether the measure of variance is statistically significant or not. The model outputs the mean and standard deviation of the *precision of the random effects*, and therefore allowed us to exclude the specification if the precisions are not statistically significant at 10% level.
- (2) If there were any estimated coefficient that **defied a prior belief we have on the direction of the value**, then we dropped that sub-model from consideration. For example, we strongly believe that as a donor country’s (high-income countries) income (GDP per capita) grows, they will be able to donate more DAH to lower-income countries, and so, if we ran a sub-model predicting DAH_d and get a negative coefficient on GDP per capita, we dropped that sub-model from consideration. Our prior beliefs on the covariates for each dependent variable are listed in Table A.2.
- (3) The forecasted trajectory growth **must not exceed observed growth rates**. We believe that a country will not grow faster than how much it has grown in the past trend. In order to come up with the bounds, we run a stochastic frontier analysis (SFA) of the change in the predicted variable against the level value of the predicted variable. SFA is just like an ordinary least squares specification, except with the addition of an additional ‘inefficiency’ term with a half-normal distribution. This allows us to estimate (for example, for GDP per capita): conditional of a country’s income, how much growth rate did we see in the country’s GDP. We ran this analysis across all of the observed data points, and derived a relationship binding the growth rates of GDP against the absolute values of GDP.

6 Creating the Forecasts

6.1 Ranking Sub-Models

In order to find out with sub-models would be able to predict a country's future the best, we ran out-of-sample predictive validity (OOS-PV) tests[11]. Simply put: we took each sub-model that passed the criteria in section 5, and instead of running it on all of the past data, we left out some number of recent most years. Following that, we ran the sub-model on the truncated past, and forecasted those years left out. For example, our GDP data extends from 1970 through 2017; we left out 15 years of data, and reran a sub-model from 1970 to 2007, and used the results of that sub-model to forecast GDP for the out-of-sample years (2003–2017).

This gave us essentially two trajectories between 2003 through 2017: the truth and the out-of-sample predictions. For each year, we computed the squared error (the difference) between these two lines, and averaged these errors for each of the neighboring years. So for example, we had squared errors for 15 data points between 2003 and 2017, and so the first mean squared error sum was just the squared error at 2003 and 2004, the second was the mean of the sum of squared errors for 2003, 2004, and 2005, and so on. We then took the square root of this new series to get the running root mean squared errors (RMSE) for a given country.

We looked at a country's 2003 RMSE values for each sub-model run, and listed out the best 10% of the sub-models (that is, the lowest 10% RMSE values), and we did so for every year out-of-sample. For a single country, we may potentially have a completely different set of sub-models for each of the OOS years. Then, for the 10% of the sub-models selected in the *first* year OOS, we only used those models to predict the *first* year of forecast for each country; the set of 10% of the sub-models selected in the *second* year OOS were used to predict the *second* year of forecast for each country, and so on, until the last year OOS model selections are used to compute the forecast the remaining years. This allowed us to narrow down every country's trajectory with the best performing OOS-PV sub-models for each year.

6.2 Uncertainty estimation

To estimate the uncertainty intervals (UI), we reran the selected, ranked sub-models from section 6.1 and simulated draws instead of just getting a mean estimate of the future. There are four types of uncertainty we implemented in forecasting:

- (i) **Model Uncertainty** : This type of uncertainty comes from having more than one

type of specification to create forecasts, and therefore we included a set of sub-models in the ensemble to incorporate for this uncertainty (which are ranked within each country-year).

- (ii) **Data Uncertainty:** If our covariates themselves had draws of the future data (for example, when we forecasted GDP as a covariate to forecast PPP), then we picked randomly from the draws of the independent variable when predicting a sub-model’s trajectory, if that covariate was included.
- (iii) **Parameter Uncertainty:** This type of uncertainty is due to the variance for the posterior distributions. Once we have run a sub-model, we simulated from each of the estimated posterior distribution to create a set of simulated coefficients. This is done by simulating from the joint precision matrix of all the parameters estimated, and therefore produces a correlated set of coefficients.
- (iv) **Fundamental uncertainty :** The in-sample data and the fitted line in the past will never line up perfectly: there will always be errors from the model fit. We needed to reflect this level of uncertainty in our forecasts as well. By extracting these empirical residuals produced by a sub-model, we forecasted future country-specific residuals by using a random walk process, where the variance of the process is the variance of the residuals from the model fit σ^2 :

ε

$$\hat{\varepsilon}_{i,t} \sim N(\varepsilon_{i,t-1}, \sigma_{\varepsilon,t}^2) \tag{6}$$

A random walk is an AR(1) process with the coefficient equal to 1: in other words, the current value is independent of last year’s value (except for the starting position), and will propagate forward with a random Gaussian noise of $\sigma_{\varepsilon,t}^2$ variance.

All of the above were used to simulate 1,000 forecasts (or draws), and so in order to construct our UIs, we took the mean and the values of the 2.5th and 97.5th quantiles to estimate 95% UIs.

Table B.1 shows all of the retrospective and prospective estimates of our health spending outcomes in 2018 USD and 2018 PPP in per capita space.

7 Ad-hoc draws correlation

7.1 Motivation

Given our current setup of compiling draws for each single year, there is no way of enforcing a temporal correlation across the draws right from the ensemble architecture. For example, the sub-models used in the first 15 years of GDP per capita forecasts were independently constructed and only depended on OOS-PV fits, while the 10th year (2032) onward all draw from the same set of sub-models. This section details the method used to generate the same correlation in the first 10 years of that example, drawing from the existing correlation from the 10th year onward.

7.2 Bivariate correlated distributions

Using the GDP per capita example: following from uncertainty estimation, once we generated approximately 1,000 forecast draws for a country and year for any of the covariates, we used the following strategy to achieve consistent temporal correlation across all time periods in the future:

- (a) For each country, we recorded country-specific Spearman's correlation coefficient across all draws between 2032 and 2050, which gave us a country-specific correlation vector.
- (b) For each value of correlation in step (a), we simulated a bivariate uniform distribution for each country and year (2018 through 2032). This simulated distribution was ranked in such a way that the marginal distributions in the joint distribution were correlated with that value of correlation coefficient we supplied (this joint distribution is known as a *copula*).
- (c) We recorded the ranks of the copula, and sorted our draws (within each country) using those temporal ranks, and therefore we ended up with complete time-series data for all draws, such that each country and year will follow the same rank correlation structure that exists between 2032 and 2050.
- (d) Finally, we calculated our final set of uncertainty intervals by taking the 2.5th and 97.5th percentiles of these correlated draws.

We used this method at the end of forecasting every metric, since one metric fed into the other sequentially.

8 Future health scenarios

We established the trajectories that our health expenditures are expected to take in the next 33 years using our ensemble models (from hereby referred to as the ‘reference’ case). The reference forecasts were built upon the basis of each country’s past trends and expected future trends from covariates. We additionally also predicted what the possible trajectories for each country would look like if they were to follow the possible optimistic and pessimistic growth rates observed globally (referred to as ‘better’ and ‘worse’ cases, respectively).

8.1 Long-term growth regressions

In order to determine what the possible better and worse growth rates for each country would be, we ran long-term growth regressions with the following specification:

$$Y_{i,T} - Y_{i,t} = \alpha + \beta Y_{i,t} + \epsilon_{i,t} \quad (7)$$

where the dependent variable represented the long term growth rate of Y for country i , which was computed either as logarithmic or logistic growth rates (for fractions).

The only independent variable we used ($Y_{i,t}$) was the value of Y_i at time t , and it served as a convergence term in this regression. This allowed us to predict the long-term growth rates of Y , conditional on a country’s level of Y at time t .

8.2 Forecasting better and worse scenarios

In order to estimate what the future better and worse trajectories would be for each country, we followed these steps (assuming that we are forecasting from 2017 through 2050, with observed data between 1995 and 2016):

- (i) We computed the 85th and 15th percentiles of the empirical residuals ϵ , as $Q_{0.85}(\hat{\epsilon}_{i,t})$ and $Q_{0.15}(\hat{\epsilon}_{i,t})$ respectively, where $Q_p(\cdot)$ is a quantile function for a percentile p .
- (ii) We computed the starting annualized growth rate from the fitted scenario regression, such that, for country i :

$$\text{Better growth rate} = \exp(\hat{\alpha}) \times \exp(Q_{0.85}(\hat{\epsilon}_{i,t})) \times (Y_{i,2016}^{\hat{\beta}})^{(1/(2016-1995))} \quad (8)$$

$$\text{Worse growth rate} = \exp(\hat{\alpha}) \times \exp(Q_{0.15}(\hat{\epsilon}_{i,t})) \times (Y_{i,2016}^{\hat{\beta}})^{(1/(2016-1995))} \quad (9)$$

- (iii) Finally, once we have established the growth rates as a function of the convergence term, we recursively created better and worse trajectories, conditional on the updated

growth rates every year, such that:

$$Y_{i,t+1} = Y_{i,t} \times \exp(\hat{\alpha}) \times \exp(Q_{0.85}(\hat{\epsilon}_{i,t})) \times (Y_{i,t}^{\hat{\beta}}) \quad (10)$$

where $\exp(\hat{\alpha}) \times \exp(Q_{0.85}(\hat{\epsilon}_{i,t})) \times (Y_{i,t}^{\hat{\beta}})$ was the conditional growth rate for a single year.

One condition that we imposed for the computed scenarios is the better projection cannot be lower than the reference projection, and the worse projection cannot be higher than the reference projection. For countries with wide forecasts where this case did happen, we moved the better and worse forecasts down and up to overlap on top of the reference line respectively.

8.3 Uncertainty estimation

The uncertainty intervals around a scenario were expected to take the same shape as the uncertainty around our reference forecasts. Therefore, once we have propagated a mean set of better and worse forecasts in section 8.2, we created the draws around our scenarios in the following way:

- (i) We took our reference forecast's mean line and the 1,000 draws around that line.
- (ii) We computed the deviation of the mean from each of the draws (in logarithmic or logistic transformation, depending on the space of the covariate).
- (iii) We took each of the scenario mean lines and added the deviations from the previous step to the mean lines, giving us 1,000 draws of the scenario projections.

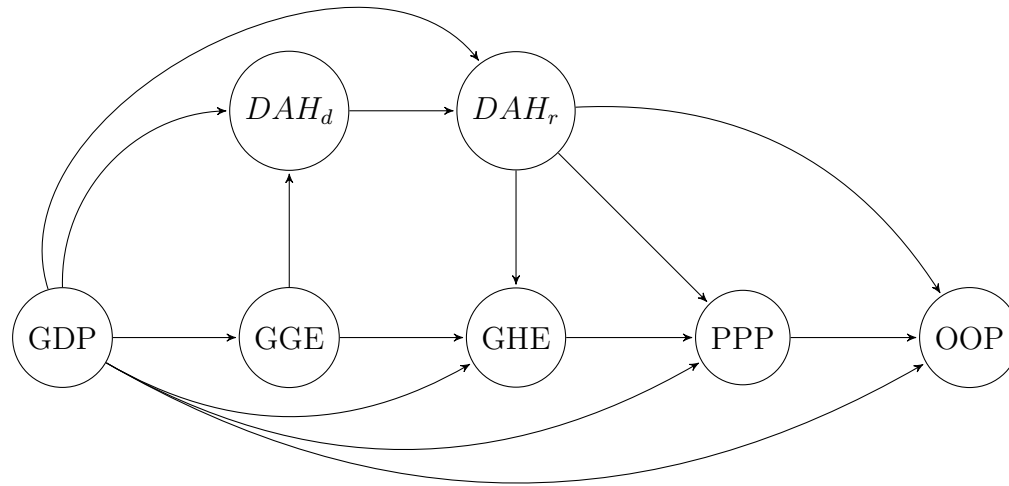

Figure set B.2 visualizes the future health scenarios of our health outcomes in per capita space (in 2018 USD).

A Tables and Figures

Table 1: Definitions of health expenditure sources

Health Expenditure Type	Definition
Development assistance for health	Financial and in-kind contributions from global health channels that aim to improve or maintain health in low- or middle-income countries.
Government health expenditure as source	Government health expenditure as source only includes domestically financed government expenditure on health, including public health spending.
Out-of-pocket expenditure	Paid by individuals for health services; considered catastrophic if exceeding 40% of a household's annual income.
Prepaid private health expenditure	Private risk pooling against catastrophic health expenditure; includes private insurance and non-governmental organizations.

A.1 State Space Diagram of Forecasting Components

A.2 Prediction and Covariates Map with Transformations

	Predicted Variables	Covariates	Extra Specifications
1	GDP per labor (both in log)		ARIMA(2-3, 1, 0)
2	GGE per GDP (logit)	GDPpc ⁺ , Pop >64 ⁺ , Education ⁺	ARIMA(0-3, 1, 0-3)
3	DAH donated per GGE (logit)	GDPpc ⁺ , GGE/GDP ⁺ , Bush Era Dummy ⁺	ARIMA(0-3, 1, 0-3)
4	DAH received per total DAH donated (logit)	GDPpc ⁻ , Pop ⁻ , Pop <15 ⁺ , TFR ⁺ , Ebola dummy ⁺ , total DAH envelope	ARIMA(0-3, 0, 0-3)
5	GHE per GGE (logit)	GDPpc ⁺ , Pop >64 ⁺ , GGE/GDP ⁺ , DAH/GDP ⁻	ARIMA(0-3, 1, 0-3)
6	PPP per GDP (logit)	GDPpc ⁺ , Pop >64 ⁺ , GGE/GDP. DAH/GDP, GHE/GDP,	ARIMA(0-3, 1, 0-3)
7	OOP per GDP (logit)	GDPpc ⁻ , Pop >64 ⁺ , GGE/GDP, DAH/GDP, GHE/GDP, PPP/GDP	ARIMA(0-3, 1, 0-3)
